## Agenda

- Bridge Concepts
- Rational Open Access Overview
- Types of Handlers
- Handler Scenarios

IBM Systems Lab Services and Training 

# Bridge Concepts

3 IBM Systems Lab Services and Training – [ibm.com/systems/services/labservices](http://ibm.com/systems/services/labservices) © 2011 IBM Corporation

IBM Systems Lab Services and Training 

## Traditional IO To SQL

- So, how do we get are legacy programs from here to there?

Here: Traditional IO	Answer: A bridge	There: SQL Data Access
-------------------------	---------------------	---------------------------

4 IBM Systems Lab Services and Training – [ibm.com/systems/services/labservices](http://ibm.com/systems/services/labservices) © 2011 IBM Corporation

IBM Systems Lab Services and Training IBM

## Legacy Program Bridge Concepts

- A technique used to transform a traditional IO operation into an SQL function call
  - A function call is a prototyped procedure within an ILE Service Program
- Benefits
  - Existing programs do not have to use SQL
  - One service program can service many legacy programs
  - One legacy program can access multiple service programs
  - Can be written in any language
  - Can utilize Call Level Interface (CLI) to access SQL Stored Procedure result set
  - Can easily be modified to use future enhancements
    - For example, ALLOCATE CURSOR, RESULT SET LOCATOR, etc.

5 IBM Systems Lab Services and Training – ibm.com/systems/services/labservices © 2011 IBM Corporation

IBM Systems Lab Services and Training IBM

## ILE Bridge Examples

Legacy Program is modified to call service program instead of performing IO

```

RPG
//DELETE(e) LEGACYFILE;
CALLP
DELETEDATABASEROWBYKEY
(DEL_Parm_List,
SQL_Results);

COBOL
//DELETE LEGACYFILE
CALL PROCEDURE
"DELETEDATABASEROWBYKEY"
USING DEL-Parm-List,
SQL-Results.
                
```

No SQL Here

Common Service Program

ADDDATABASE ROW

UPDDATABASE ROWBYKEY

DELETEDATABASEROWBYKEY

IBM Systems Lab Services and Training IBM

### De-coupling UI and DB

- Rational Open Access
  - Handlers intercept traditional IO operations
  - Minimal change to existing RPG programs
- Handlers:
  - Transform 5250 to any UI device
  - 3rd party tools available
  - Transform data access to SQL
    - Utilize advanced database feature and function
- Other tools available for mining source code
  - Identify and extract business rules

Rational Open Access: RPG Edition

Tools available for extraction (Rational, XAnalysis, etc.)

DB2

IBM Systems Lab Services and Training IBM

### RPG Handler Bridge Examples

Legacy Program is modified to use SPECIAL device. Minor changes to program.

```

                FORDHDR UF E
                HANDLER(
                'PGM or SrvPGM')
                C... WRITEORDHDRR
                C... DELETORHDRR
            
```

OPM or ILE RPG

Handler Program intercepts IO and calls SQL service program

```

                CALLP
                ADDDATABASEROWBYKEY
                (ADD_Parm_List,
                SQL_Results);
                CALLP
                DELETEDATABASEROWBYKEY
                (DEL_Parm_List,
                SQL_Results);
            
```

No SQL Here

Common Service Program

```

                ADDDATABASE
                ROW
                UPDATABASE
                ROWBYKEY
                DELETEDATAB
                ASEROWBYKEY
            
```

SQL Performed Here

# Rational Open Access Overview

9 IBM Systems Lab Services and Training – [ibm.com/systems/services/labservices](http://ibm.com/systems/services/labservices) © 2011 IBM Corporation

IBM Systems Lab Services and Training 

## Rational Open Access: RPG Edition

- Provides a way for RPG programmers to use the simple and well-understood RPG I/O model to access SQL procedures used by SQL based languages.
  - Everyone is now playing by the same rules
- Open Access opens up RPG's file I/O capabilities allowing HLL programmers to write innovative I/O handlers that:
  - Transform traditional record at a time I/O operations to SQL set based operations
  - Take advantage of data centric programming techniques
    - RI
    - Auto-generated values
    - Advanced embedded SQL programming techniques

1 IBM Systems Lab Services and Training – [ibm.com/systems/services/labservices](http://ibm.com/systems/services/labservices) © 2011 IBM Corporation

IBM Systems Lab Services and Training IBM

### Open Access Structure

- An Open Access application has three parts:
  - An RPG program that uses normal RPG coding to define an Open Access file and use I/O operations against the file.
  - A handler procedure or program that is called by Open Access to handle the I/O operations for the file.
  - The data access service program that the handler is using or communicating with.
- Open Access is the linkage between parts 1 and 2.
- Licensed program 5733-OAR is required to use Open Access at runtime.
  - Fee based
  - Announced for 7.1, PTF'ed to 6.1
    - 6.1 PTFs: SI39480, SI39914

IBM Systems Lab Services and Training – [ibm.com/systems/services/labservices](http://ibm.com/systems/services/labservices) © 2011 IBM Corporation

IBM Systems Lab Services and Training IBM

### Where the handler fits in

- Data Centric Programming Cornerstones
  - Common service program used by both traditional and new development
  - Handler program can use 7.1 result set access capability

The diagram illustrates the data flow and coding locations in an Open Access application. It shows a sequence of components: P1 HLL Program (green box), B1 Bridge Program (yellow box), Service Program (dashed box containing D1 Data Access Object and V1 SQL View), and T1, T2... RDBMS (blue box). A red box encloses the Service Program and V1 SQL View components. A red callout box points to the B1 Bridge Program with the text 'ASSOCIATE LOCATOR ALLOCATE CURSOR Coded here'. A green arrow labeled 'Reverse Engineering' points from the RDBMS back to the HLL Program. A blue arrow labeled 'Forward Engineering' points from the HLL Program through the Bridge Program to the RDBMS. A green box at the bottom left is labeled 'No SQL coded here' and a blue box at the bottom right is labeled 'SQL coded here'.

IBM Systems Lab Services and Training IBM

## RPG HANDLER Keyword

1 Line of code per file

```

F          DISK
F          handler('HANDLER_W1')
F          ExtDesc('EMPLOYEE')
F          USROPN
/Free

Open(e) Surrogate;
READ(e) Surrogate;
Close(e) Surrogate;
Return;

/End-Free
    
```

RPG IO operations coded as usual

IBM Systems Lab Services and Training IBM

## Handler Considerations

- Record and Key Data
  - 2 Modes: Name values or Data structures
    - Name values only available for externally described data
    - Data structures map directly to IO buffers
- Establish IO Feedback and stateInfo sizes
  - IO Feedback for returning error
  - stateInfo for tracking where you are
- Not all data is available for SQL statement
  - May need to wait until specific IO operation occurs before constructing and executing statement
  - Utilize userArea and stateInfo parameters to build as you go
- Handler can be program or service program

16 IBM Systems Lab Services and Training – [ibm.com/systems/services/labservices](http://ibm.com/systems/services/labservices) © 2011 IBM Corporation

## Record and Key Data Handling

- Name values
  - Each data item is passed with attribute information
    - Field names, size, actual data
- Data structures
  - Data is passed as a record
    - Information about the data must be provided by handler
- Keep it simple
  - useNameValues = '1' can be very complex
    - Ideal for varying-list dynamic SQL programs
  - useNameValues = '0'
    - Ideal for mere mortals
    - Data structures can be mapped to external file definitions
    - Will require multiple handlers – 1 per file format

## Handler Program vs Handler Service Program

- |  |  |
|--|--|
| <ul style="list-style-type: none"> <li>▪ Handler Program</li> <li>▪ Advantages               <ul style="list-style-type: none"> <li>– Single program can be generic</li> <li>– Record format specific modules can be bound to generic handler</li> <li>– *INZSR can be utilized for one time only operations</li> </ul> </li> <li>▪ Disadvantages               <ul style="list-style-type: none"> <li>– Requires extra coding for different open scenarios</li> </ul> </li> </ul> | <ul style="list-style-type: none"> <li>▪ Handler Service Program</li> <li>▪ Advantages               <ul style="list-style-type: none"> <li>– Multiple entry points can be used for different open scenarios</li> <li>– Record format specific modules can be bound to generic handler</li> </ul> </li> <li>▪ Disadvantages               <ul style="list-style-type: none"> <li>– *INZSR cannot be used                   <ul style="list-style-type: none"> <li>• Requires separate module for one time only operations</li> </ul> </li> </ul> </li> </ul> |
|--|--|

## Database Operation Type Constants

- The RPG IO operation is passed as an unsigned integer
- The RPG OA provided copy book (QRNOPENACC) contains constants mapped to the possible values

	Constant	Example
D QrnOperation_OPEN...	C	1
D QrnOperation_READ...	C	4
D QrnOperation_READE...	C	6
D QrnOperation_CHAIN...	C	9
D QrnOperation_SETLL...	C	12
D QrnOperation_UPDATE...	C	14
D QrnOperation_WRITE...	C	15
D QrnOperation_DELETE...	C	16
D QrnOperation_CLOSE...	C	18

## Processing RPG IO Operations

- An rpgStatus value of zero indicates success
  - Any valid IO error status code can be used to signal an error
- Coding tip:
  - Create local handler procedures for each RPG IO Operation
    - Use rpgStatus as the return value
  - For handler programs use return with \*LR off or the MAIN keyword (6.1)
    - Not an issue if using service programs

```

Example Code
QQA_Ds.rpgStatus = *Zero;

select;
when QQA_Ds.rpgOperation = QrnOperation_OPEN;
  QQA_Ds.rpgStatus = Handle_Open0;
when QQA_Ds.rpgOperation = QrnOperation_CHAIN;
when QQA_Ds.rpgOperation = QrnOperation_READ;
when QQA_Ds.rpgOperation = QrnOperation_READE;
when QQA_Ds.rpgOperation = QrnOperation_UPDATE;
when QQA_Ds.rpgOperation = QrnOperation_DELETE;
when QQA_Ds.rpgOperation = QrnOperation_WRITE;
when QQA_Ds.rpgOperation = QrnOperation_CLOSE;
  DeAlloc QQA_Ds.statelInfo;
Other;
ENDSL;
return;

```

## User Defined Parameters

- userArea and stateInfo
  - Pointers to user defined variables
  - Typically data structures
- userArea
  - Use to pass additional information to handler from RPG program
  - For example, dynamic SQL statement
- stateInfo
  - Use to track program state information
  - For example, last operation successfully executed

## Sample User Defined Structures

- Use this data structure to pass additional parameters to further enhance RPG ops.
- For example
  - Open type, blocking factor, indicator array, etc.
- Use this data structure to pass the state information about a given file or operation
- For example
  - File name, last successful op, etc

```

userArea
//userArea Data structure
template
D Optional_Parms...
D           Ds
D Open_attr...
D Read_attr...
D Update_attr...
D Delete_attr...

```

```

stateInfo
//stateInfo data structure
template
D stateInfo_parms...
D           Ds
D Last_Op...
D                               25 Varying

```

IBM Systems Lab Services and Training IBM

## Handling RPG Open

```
FEMPADDRSL1UF E K DISK
F handler('UPDHANDLER')
```

**RPG Implicit OPEN**

'UPDHANDLER'

→

HANDLE\_OPEN

←

PREPARE\_SQL\_STATEMENT

```
select;
when
rpgIO.rpgOperation =
QrnOperation_OPEN;
  rpgIO.rpgStatus =
  Handle_Open(rpgIO);
```

```
If rpgIO.externalFile.library = "LIBL";
  TableReference = rpgIO.externalFile.name;
Else;
  TableReference =
  %TRIMR(rpgIO.externalFile.library) + '/' +
  %TRIMR(rpgIO.externalFile.name);
ENDIF;
SQLString =
'SELECT * FROM ' +
  %TRIMR(TableReference) + ' ' +
WHERE EMPNO = ? FOR FETCH ONLY';
IF Prepare_SQL_Statement(SQLString) =
*On; retField = 1299;
ENDIF;
```

```
EXEC SQL Prepare S1 FROM
:v_SQL_String;
If SqlState = '00000';
EXEC SQL
Declare C1
SCROLLCURSOR FOR S1;
If SqlState <> '00000';
  RetField = *ON;
EndIf;
Else;
  RetField = *ON;
EndIf;
```

23 IBM Systems Lab Services and Training – ibm.com/systems/services/labservices © 2011 IBM Corporation

IBM Systems Lab Services and Training IBM

## Handling RPG CLOSE

```
*INLR = *On;
Return;
```

**RPG Implicit CLOSE**

'UPDHANDLER'

→

HANDLE\_CLOSE

←

CLOSE\_SQL\_CURSOR

```
when
rpgIO.rpgOperation
=
QrnOperation_CLOSE;

rpgIO.rpgStatus =
Handle_Close
(rpgIO);
```

```
Dealloc
rpgIO.stateInfo;

Close_SQL_Cursor(
);
```

```
EXEC SQL CLOSE
rpgIOInp_C1;
```

IBM Systems Lab Services and Training 

# Types of Handlers

25 IBM Systems Lab Services and Training – [ibm.com/systems/services/labservices](http://ibm.com/systems/services/labservices) © 2011 IBM Corporation

IBM Systems Lab Services and Training 

## Methods for Passing Data To and From a Handler

- Two methods available
  - Structure-based
  - Column-based
- Structure-based
  - Data and Key values passed using buffers
  - Buffers can be externally described
  - Good for getting feet wet
- Column-based
  - Data and key values passed as individual items
  - Each item contains data and key attributes
  - More advanced capabilities
- Dynamic SQL required in either case to minimize number of handlers

26 IBM Systems Lab Services and Training – [ibm.com/systems/services/labservices](http://ibm.com/systems/services/labservices) © 2011 IBM Corporation

## Generic Database Handlers

- Various methods can be used to build handlers
- Format-based
  - Best for reengineering startup and structure-based method
  - Handler program uses template based on physical file format
  - Data access module utilizes fixed-list dynamic SQL
- Statement-based
  - Best for:
    - Column-based method
    - reengineering multiple distinct format LFs to use a single handler
  - Data access service module utilizes varying-list dynamic SQL
- Procedure-based
  - Strategic handler intended for 7.1 and beyond
  - Best for result set consumption and “one and done” type functions
    - E.g. SQL MERGE, ROLLUP, CUBE, etc

## Using a Fixed-List Handler

- Used with externally described data structures or templates
  - Record format in program is fixed
- Row selection and ordering are dynamic
  - Handler implicitly determines WHERE and ORDER BY from external file attributes
    - DDS Select/Omit criteria is implicitly converted to WHERE
    - System API required to retrieve key columns
    - E.g. file uses K8, K1, K2. K8 is for SETLL and K1 and K2 for ordering
- User area provided for passing explicit WHERE or ORDER BY clauses
  - Must code logic in handler to close existing cursor then prepare, declare and open new cursor
- An SQL Descriptor is not required for fixed list dynamic SQL
  - Data is written to in one operation

IBM Systems Lab Services and Training IBM

## Handling RPG Using Fixed-List Handler

FEMPADDRSL1UF E K DISK  
 F handler('FMTHANDLER')

RPG Implicit  
 OPEN

```

    FrcdFile_t IF E K DISK TEMPLATE
    F EXTDESC('EMPADDRESS')
    F RENAME(empAddr:rcdFormat)

    D rcdFormat_t...
    D DS TEMPLATE
    D keys_t DS LIKERECD(rcdFormat:*KEY)
    D TEMPLATE
    D Ind_Array_t...
    D S 5i 0 DIM(7)
    D TEMPLATE
  
```

29 IBM Systems Lab Services and Training – [ibm.com/systems/services/labservices](http://ibm.com/systems/services/labservices) © 2011 IBM Corporation

IBM Systems Lab Services and Training IBM

## Using a Statement-based Handler

- Used with column-based method, record format varies
  - Allows single handler for multiple formats
- Handler determines ordering via passed key column list
  - System API not required
  - User area can be used to pass entire statements (update, delete, etc)
- An SQL Descriptor must be used in data access service modules
  - SQL ALLOCATE DESCRIPTOR or SQLDA can be used
  - SQL PREPARE INTO can be used to describe table columns and parameters

30 IBM Systems Lab Services and Training – [ibm.com/systems/services/labservices](http://ibm.com/systems/services/labservices) © 2011 IBM Corporation

## Using a Procedure-Based Handler

- This type of handler is used when SQL Stored Procedures are already in use by new or external applications
- The SQL Stored Procedure name is passed via the User Area.
  - Best approach for minimal number of handlers
- The handler consumes the result set created by the stored procedure and returns data using column based methods
  - Consuming result sets via embedded SQL available in 7.1
  - Can be done using Call Level Interface APIs on prior releases
- Ideal for replacing long running IO intensive processes such as:
  - archive and purge (use MERGE 7.1)
  - Mass aggregations (use ROLLUP or CUBE 6.1)
  - Mass inserts, copies, duplication, etc

## Handler Scenarios

- Format based handlers and data access service programs
  - Most flexible, least manageable
- Custom handlers, single data access service program
  - Flexible and manageable
- Generic handler, single data access service program
  - Least flexible, most manageable

IBM Systems Lab Services and Training IBM

# Handler Scenarios

33 IBM Systems Lab Services and Training – [ibm.com/systems/services/labservices](http://ibm.com/systems/services/labservices) © 2011 IBM Corporation

IBM Systems Lab Services and Training IBM

## Out with the OLD, In with the New

HLL IO Operation	IS/OS Module
RPG SETxx or COBOL START	QDBGETKY (Position into an index)
RPG CHAIN or READE or COBOL READ (Dynamic)	QDBGETKY (Position into an index followed by random read by RRN)
RPG READ or COBOL READ (Sequential)	QDBGETSQ or QDBGETM (Sequential read of 1 or multiple records respectively. Applies to both keyed and non-keyed reads.)
RPG or COBOL WRITE	QDBPUT or QDBPUTM (insert 1 or multiple records respectively)
RPG or COBOL DELETE	QDBUDR (Delete a record)
RPG UPDATE or COBOL REWRITE	QDBUDR (Update a record)

**RPG HLL IO**

Open, Close

Set.., CHAIN, READE

READ

WRITE

FEOD

Others...

**QDB...**

- Search Index
- Retrieve Record

**HANDLER**

- SQL Service

34 IBM Systems Lab Services and Training – [ibm.com/systems/services/labservices](http://ibm.com/systems/services/labservices) © 2011 IBM Corporation

## Possible Handler Scenarios

- Areas providing best return on reengineering effort
  - SQL blocked FETCH versus RPG READE loop
  - SQL blocked INSERT versus RPG WRITE loop
  - SQL searched UPDATE/DELETE versus RPG UPDATE/DELETE loop
  - SQL JOIN versus RPG READE then RPG CHAIN
  - SQL MERGE versus HLL Archive/Purge

## RPG BLOCK(\*YES \*NO \*IT DEPENDS)

- BLOCK(\*YES) Allows compiler generated blocking for input only files
  - Positioned by SETGT, SETLL or CHAIN
  - Processed via RPG READ operations
  - OVRDBF SEQONLY(\*YES n) required to increase blocking factor
- If any READE or READPE operations are used, NO record blocking will occur for the input file (as stated in the RPG Manual)
  - The BLOCK(\*YES) is specified the RPG compiler will issue a severity 10 error indicating blocking is not allowed
- The compiler will generate blocking code for output only files, however:
  - IBM i OS may turn off blocking at file OPEN
  - A message will be logged stating the output only ODP has been changed to SEQONLY(\*YES)
- SQL Read/Write only cursors are always blocked at most efficient blocking factor per release

## SQL FETCH Processing

- The SQL format based service program defines the host array based on externalFile
- The host array is populated by the SQL FETCH function on first call
  - The first array occurrence is moved to the inputBuffer
  - Subsequent calls result in the occurrence being incremented and the next row is returned from the array
  - This continues until all occurrences have been returned.
    - The next call results in another FETCH

Handler performs 1 I/O and populates host array  
 Rows are returned 1 at a time per RPG READ  
 Data is CPU bound, not I/O bound

## SQL Blocked Insert

- Opposite of Blocked Fetch
- Huge performance benefits when combined with
  - SMP for parallel index maintenance
  - OVRDBF REUSEDLT (\*NO) for bulk inserts

Rows are passed to handler 1 at a time per RPG WRITE  
 Handler stores passed rows in array  
 When array is full 1 I/O to insert up to 32767 rows into database  
 FEOD indicates end of logical unit of work

IBM Systems Lab Services and Training IBM

### Eliminating Program Joins

- Scenario 1
  - Primary file contains HANDLER keyword.
  - Secondary files become templates
  - First READE results in single IO to SQL Join View.
  - Handler returns 1 joined row.
  - CHAINs are no longer needed.
- Scenario 2
  - All files contain the HANDLER keyword.
  - First READE results in single IO to SQL Join View.
  - Handler returns primary file row
  - For subsequent CHAINs handler returns secondary file row data using EVAL-CORR

**RPG Read and CHAIN Nested Loop**

```
For Times = 1 to 32767;
  READE(e) search-arg PRIMARYFILE;
  If %EOF;
    Leave;
  Endif;
  //CHAIN(e) SEC_FILE1;
  //CHAIN(e) SEC_FILE2;
  //CHAIN(e) SEC_FILE3;
EndFor;
```

**SQL Blocked Fetch of Join View**

```
CREATE VIEW JOIN_VIEW AS
SELECT ...
FROM PRIMARYFILE
JOIN SEC_FILE1 USING(KEY1)
JOIN SEC_FILE2 USING(KEY2)
JOIN SEC_FILE3 USING(KEY3);

EXEC SQL
FETCH NEXT FROM JOIN_VIEW_C1
FOR 32767 ROWS INTO
:ViewInputArray;
```

39 IBM Systems Lab Services and Training – ibm.com/systems/services/labservices
© 2011 IBM Corporation

IBM Systems Lab Services and Training IBM

### Result Set Consumption

- HLL can now access a result set from an SQL stored procedure
- First READE is transformed into stored procedure call.
- Stored procedure opens result set cursor.
- Handler associates and allocates a cursor for the result set
- Handler performs blocked fetch from result set cursor.

**RPG Read and CHAIN Nested Loop**

```
For Times = 1 to 32767;
  READE(e) search-arg PRIMARYFILE;
  If %EOF;
    Leave;
  Endif;
  //CHAIN(e) SEC_FILE1;
  //CHAIN(e) SEC_FILE2;
  //CHAIN(e) SEC_FILE3;
EndFor;
```

**Stored Procedure Example**

```
CREATE PROCEDURE RS1_PROC (
  IN P_WDEPT CHAR(3))
RESULT SETS 1
DECLARE RS1_PROC_C1 CURSORFOR
SELECT * FROM JOIN_VIEW
WHERE WORKDEPT = p_WDEPT;
OPEN CURSOR RS1_PROC_C1;
```

↕

**Handler Program Example**

```
EXEC SQL CALL RS1_PROC (E11);
EXEC SQL ASSOCIATE RESULT SET LOCATORS
(:RS_Loc1) WITH PROCEDURE RS1_PROC;
EXEC SQL ALLOCATE C1 CURSOR FOR RESULT
SET :RS_Loc1;
EXEC SQL FETCH NEXT FROM C1 FOR n ROWS
INTO:ViewInputArray;
```

## Handling RPG UPDATE using SQL Extended Indicator Support

```
Update(E) EMPADDR inpRecord;
If %Error; MESSAGETXT = 'Error-Review Joblog';
Else;
  MESSAGETXT = 'Address Changed Successfully';
ENDIF;
```

```
select;
  when
  rpgIO.rpgOperation =
  QrnOperation_UPDATE;

  rpgIO.rpgStatus =
  Handle_Update(rpgIO)
  ;
```

```
updIndAry = -7;
If updRcd.ADDRLINE1 <>
  OLD_ROW.ADDRLINE1;
  updIndAry(1) = *Zero;
ENDIF;
// Repeat the above for each
updateable column
If
  Update_Columns_Using_Extended
  _Indicators(updRcd
  :updIndAry);
  RetField = 1299;
ENDIF;
```

```
EXEC SQL
UPDATE empaddress
SET ADDRLINE1 =:updRcd.ADDRLINE1:Ind_Ary_1,
  ADDRLINE2 = :updRcd.ADDRLINE2:Ind_Ary_2,
  ADDRLINE3 = :updRcd.ADDRLINE3:Ind_Ary_3,
  CITY = :updRcd.CITY:Ind_Ary_4,
  STATE = :updRcd.STATE:Ind_Ary_5,
  ZIPCODE = :updRcd.ZIPCODE:Ind_Ary_6
WHERE EMPNO = :updRcd.EMPNO;
If SqlState = '00000';
  EXEC SQL COMMIT;
Else;
  RetField = *ON;
ENDIF;
```

## Minimizing Mass Updates

- First READE results in SQL mass update or delete
- Handler performs 1 I/O and returns end-of-file if successful
- FEOD commits transaction

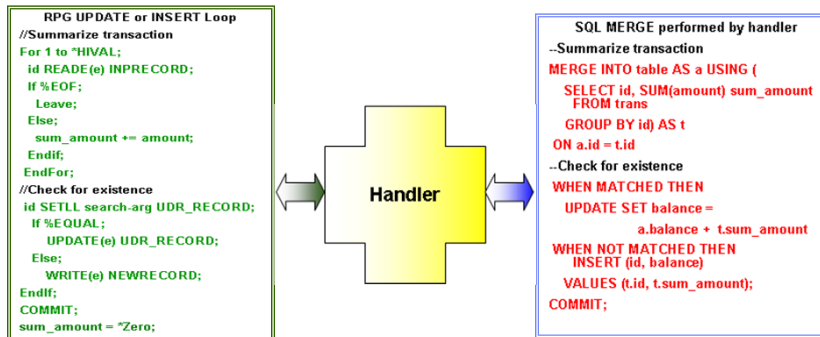

```
RPG UPDATE/DELETE Loop
FSURROGATE IF E DISK
F handler(HANDLER_W1)
SETLL search-arg UDR_RECORD;
If %EQUAL
DOU %EOF
  READE(e) search-arg UDR_RECORD;
  If %EOF;
  Leave;
  Endif;
  DELETE(e) UDR_RECORD;
  // OR
  UPDATE(e) UDR_RECORD;
EndDo;
FEOD(Surrogate);
EndIf;
```

```
SQL searched UPDATE or DELETE
EXEC SQ
UPDATE SQL_VIEW SET(COL1) = (value)
WHERE COL2 = search-arg;
// OR
DELETE SQL_VIEW
WHERE COL2 = search-arg;
COMMIT;
```

## SQL MERGE – Combining UPDATE and/or INSERT

- MERGE statement added in 7.1
  - Combines summary, existence check, update or insert all in 1 SQL statement
- First READE results in single MERGE execution
- Handler performs 1 SQL statement and returns end-of-file if successful
- FEOD commits transaction

## Rational Open Access: RPG Edition Recap

- Simplifies bridging RPG programs to new SQL services
- Start out using data structure approach
- Once comfortable, move up to names values
- Use generic handler if bridging is temporary
