

STRATEGIC BUSINESS SYSTEMS: 2009 WINNER

Power Systems Innovation Award: Best Web Solution
from IBM and COMMON

Why Use Zend Framework?

Alan Seiden

PHP on IBM i consultant/developer

email: aseiden@sbsusa.com

blog: <http://alanseiden.com>

Strategic Business Systems, Inc.

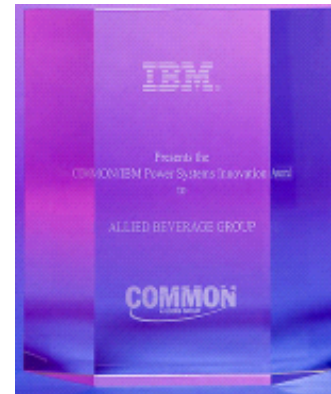

The PHP Company

- **Developing Web apps on IBM i (and iSeries, i5...) since 1996**
- **Based in Ramsey, New Jersey**
- **IBM Business Partner**
 - Power Systems hardware, software, development, consulting
- **Zend Business Partner**
 - Working with Zend since they brought PHP to IBM i in 2006
 - We offer Zend's training and Zend Server software to complement our consulting/development services

Alan Seiden

PHP on IBM i Developer / Consultant / Mentor

- Contributor to IBM's Redbook *PHP: Zend Core for i5/OS*
- First IBM i developer certified in Zend Framework
- Developer of IBM/COMMON's "Best Web Solution" of 2009

Contact: aseiden@sbsusa.com or 201-327-9400

Blog/articles: <http://alanseiden.com>

What we'll discuss today

- **Zend Framework as the premier PHP framework**
- **Why ZF is a great match for the IBM i**
- **What ZF can do for your PHP/i projects**
- **How to get started!**
- **Questions**

What I've been doing lately with PHP and ZF

Authenticate to Windows AD

- **Options come from config.ini file:**

```
ldap.server1.host = ad.alliedbeverage.com
ldap.server1.useStartTls = false
ldap.server1.accountDomainName = mydomain.com
;...more
```

- **Authenticate to AD!**

```
$qualifiedAdUsername = 'MYDOMAIN\username'
$authAdapter = new Zend Auth Adapter Ldap($options,
    $qualifiedAdUsername, $password);
$auth=Zend Auth::getInstance();
$result=$auth->authenticate($authAdapter);
```

Zend Framework

- **A free, open source, cross-platform collection of components written in PHP**
 - Over 70 PHP components to simplify common tasks, including:
 - Web form creation
 - Database access
 - Web services
 - Multi-language (English, French, Spanish...)
- **Included with Zend Server for IBM i and at <http://framework.zend.com>**

More than components

- **Optionally, a starting point for your applications, providing modular design**
- **It provides standards and functionality but does not limit you**
- **“Use at will” philosophy**

More benefits of ZF

- **Safe license for corporate use**
 - Use ZF's code however you like
 - <http://framework.zend.com/license>
- **High quality, unit tested**
- **It keeps up with trends and APIs**
 - Compatibility with diverse database systems, authentication standards (Windows AD) and APIs (e.g. Twitter)

Zend Framework Community

- **Contributors include individuals and companies. Companies include:**
 - Zend (of course)
 - IBM
 - OmniTI
- **Technology partners:**
 - Adobe, Google, IBM, Microsoft, nirvanix, Strikelron
- **Individuals:**
 - Me! Improvements for IBM i developers

Here's why ZF reminds me of the "i" world

- **Appreciation of standards: naming, parameter lists**
- **The tools you need are already integrated**
 - Common components (template system, emailer, etc.) are there for you; no need to research/download/install
 - Upgrades like a "cume tape"—all components upgraded as a well tested unit
- **Support available—from Zend**
 - Similar to phoning IBM about i/OS

Why ZF's time is right

- **PHP is being used for critical apps on IBM i**
- **It's time for professional practices**
 - Standards and consistency
 - Awareness of security
 - Reuse and easy maintenance of code
 - Training and support
 - Doing it “right”
- **ZF gets you there—“Enterprise PHP”—faster—and keeps you in control**

ZF's birth, early years, and maturity on i5

- **2005: PHP Collaboration Project at ZendCon**
 - Started as collection of components but coalesced
 - PHP 5, object oriented (OO) from the start
 - Set example of OO design patterns and practices
- **2007-2010: Fast progress**
 - July 2007: GA version 1.0
 - Feb. 2009: version 1.70 with db2/i5 support
 - Oct. 2010: version 1.11.0; minor releases every couple of weeks
- **April 2009: ZF/i application won COMMON's "best web solution"**

COMMON award for best web solution 2009

**Allied Beverage Group's
“eBiz”**

**Wine catalog/ordering system
on IBM i**

Built in Zend Framework

**Full-text catalog search in
native db2**

Allied Beverage eBiz live demo (if time)

Welcome,
Angel Wang #100

Object Orientation

(Instant 2-slide intro)

Object Orientation (OO)

Here is an incredibly quick summary of OO, which you'll see used throughout ZF

OO Concept	Analogy in i5	Example
Property	a field in a data structure	<code>\$_orderNum</code>
Method	function or subprocedure	<code>isOrder()</code>
Class	Imagine an intelligent data structure containing both data (properties) and programming logic (methods), which are both called "members" of the class	<pre>class Order { protected \$_orderNum; function isOrder() { . . . } . . . }</pre>

OO Syntax

- **The arrow (->) lets you access the members (methods and properties) of an object instance**
 - `$controller = $this->getRequest()->getControllerName();`
- **Sometimes you'll also see the double colon (::), which is similar, but is used when a member is "static" (one per class)**
 - `echo Zend_Registry::get('user');`
- **If you can read the notation above, you can read ZF code. You will learn to appreciate its simplicity.**

For more on OO PHP

**See Mike Pavlak's
“Intro to OO PHP”
here at OMNI
1:15 pm**

**Convenient to
include ZF**

ZF is pre-loaded and ready to use

On IBM i, ZF comes pre-loaded with Zend Server in
`/usr/local/zendsvr/share/ZendFramework/library`

This “library” folder is pre-pathed in PHP.INI:

```
include_path =  
    ".:/usr/local/zendsvr/share/ZendFramework/library  
    :/usr/local/zendsvr/share/pear"
```

**This path lets your PHP applications find all the
ZF components.**

Autoloader handles “require/include” for you

- **Normally you have to require or include any PHP classes you use.**

- E.g. `require_once 'Zend/Form.php';`
- Then `$form = new Zend_Form;`

- **Autoloader avoids this**

- Follow PEAR convention for class/file names
- E.g. `Zend_Form` means `Zend/Form.php`
- Put this in bootstrap file ONCE:

```
require_once 'Zend/Loader/Autoloader.php';  
$loader = Zend_Loader_Autoloader::getInstance()->  
    setFallbackAutoloader(true);
```

- Now you won't need a require or include statement to do:

```
$form = new Zend_Form(); // works for your own classes too!
```

Model-View- Controller Pattern

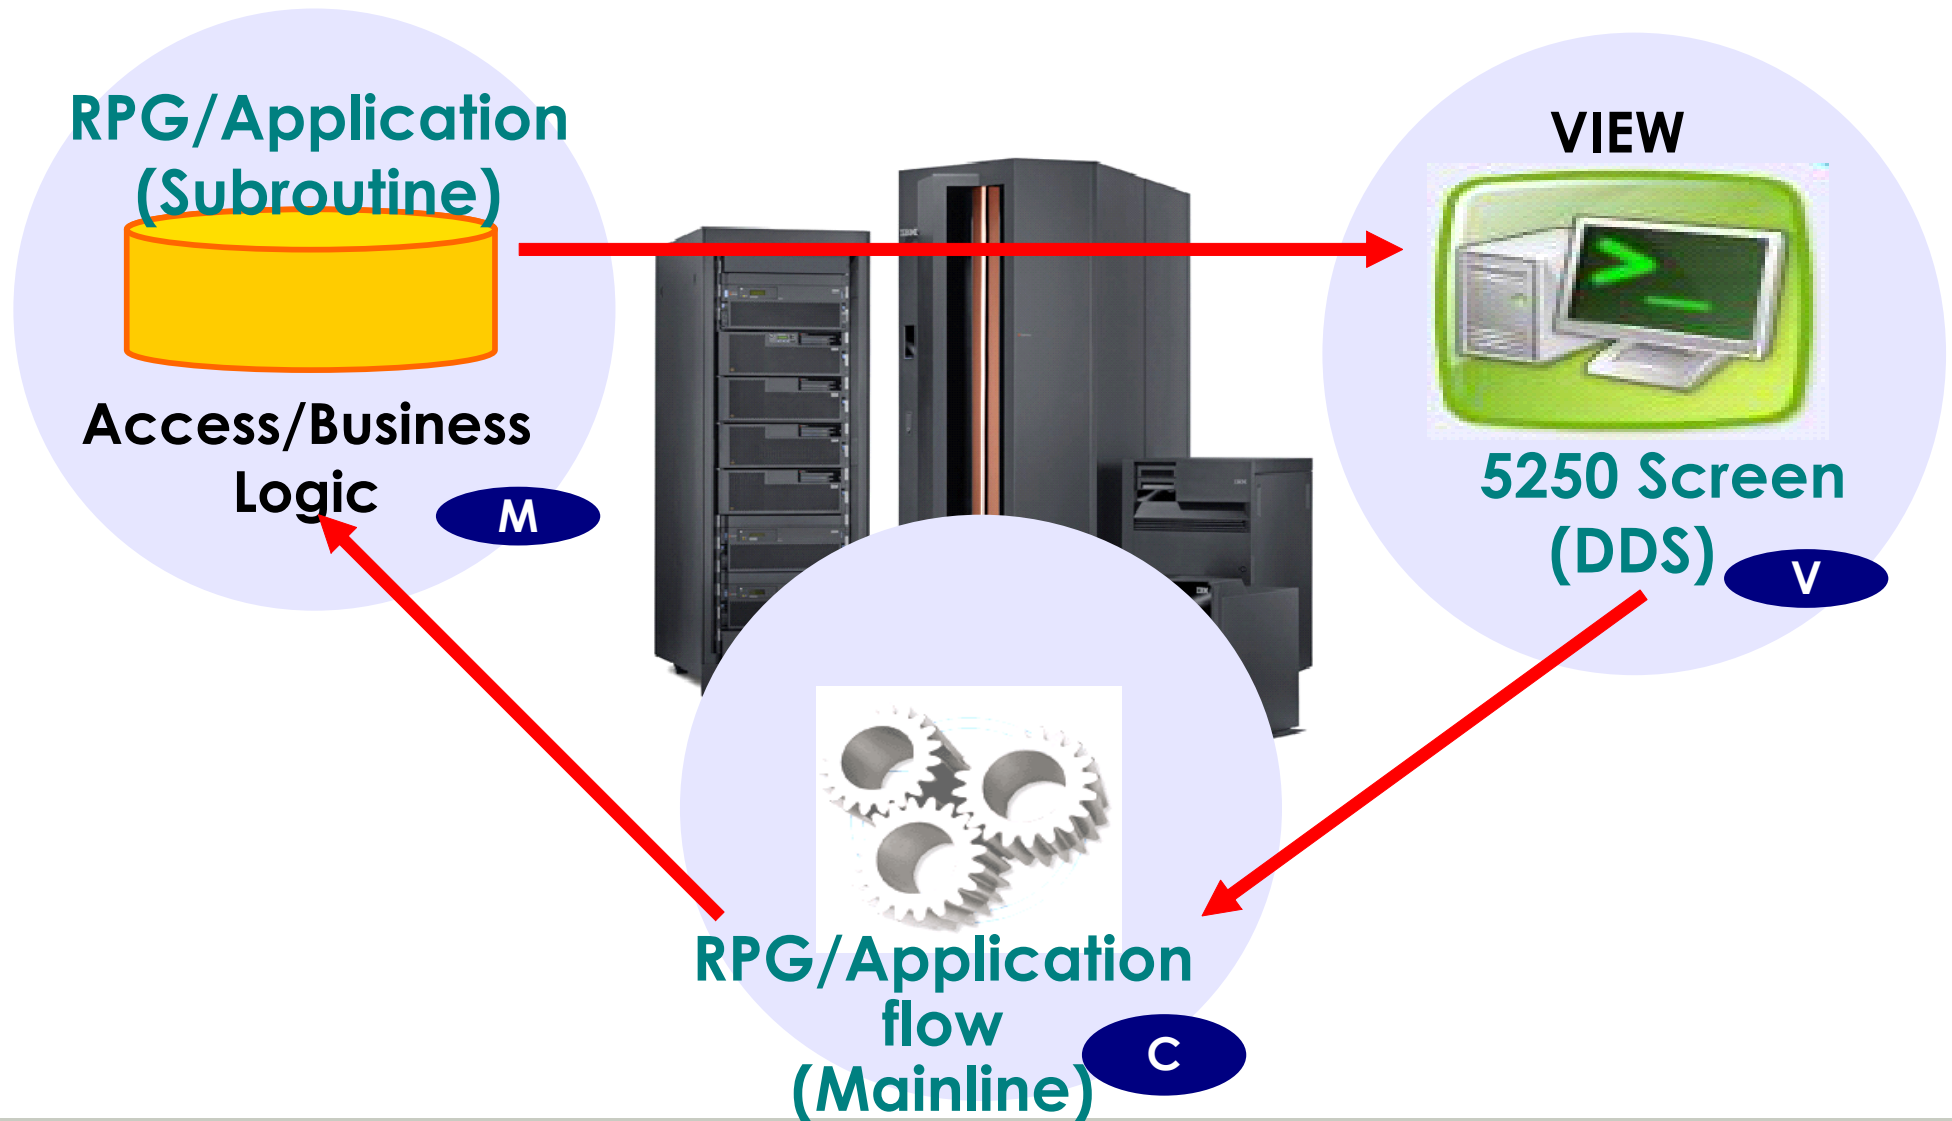

Model – View – Controller (MVC) design pattern

- **You already know this pattern from RPG/DDS**
- **With green screens, IBM handles it under the covers, so you take it for granted**
- **On the web, you must define your application's structure more explicitly**
- **Be patient...MVC seems strange at first, but you'll soon realize that you've been here before...**

MVC in detail

- **Model**
 - Reusable classes that access these resources:
 - Data
 - Business rules
 - Keep SQL and application details in one place
- **View**
 - Templates containing HTML or other output, with small bits of PHP
 - Plunk your HTML into a “view” without worrying about overwriting your mainline PHP code—helps web designers work with business programmers
- **Controller (action controller)**
 - Application flow
 - Connects model and view
 - Don’t confuse with “front controller,” which just initializes the MVC
- Next: MVC from an RPG perspective

RPG Model View Controller (MVC)

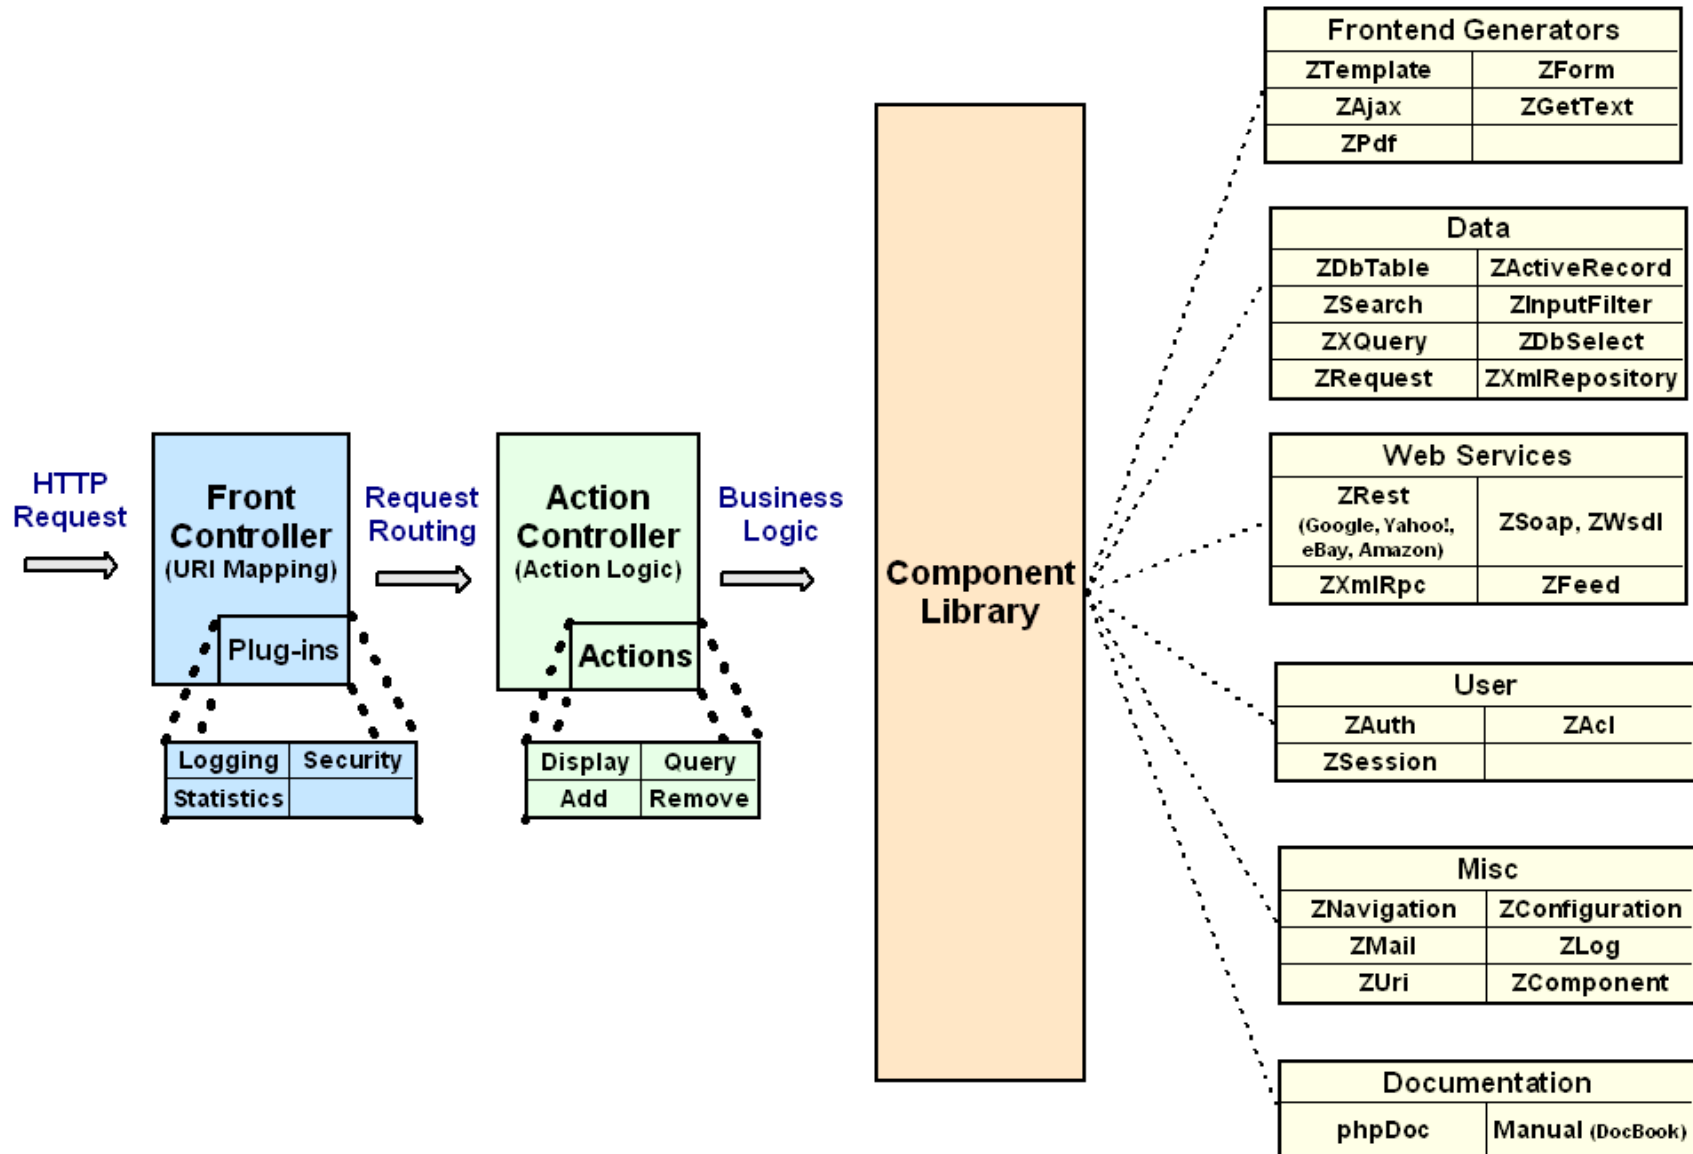

Confession

- **For my first attempt with ZF, I put all my SQL in the controller**
- **It gave me a feeling of accomplishment**
- **The MVC police did not appear**
- **Later, I moved the SQL into a model class**
 - Simplified the controller, which was getting complex and hard to understand
 - Made the SQL reusable

Initialize MVC

Front controller to action controller

Front controller routes “friendly” URL request

- **Default routing convention:**

- `http://example.com/controller/action/param1/value1...`

Controller maps
to class name

Action maps to
method name

Param/value pairs
are passed to
action

All requests routed through index.php in doc root

Document root is the only public folder.

index.php:

- initializes application
- instantiates Front Controller

Apache configuration

Most tutorials suggest `.htaccess`, but I prefer to use the main Apache config file:
`/www/zendsvr/conf/httpd.conf`

```
Listen 80
Listen 10088
RewriteEngine on

NameVirtualHost 10.11.12.13:80
<VirtualHost 10.11.12.13:80>
    DocumentRoot /www/ebiz/htdocs/html
</VirtualHost>

<Directory /www/ebiz/htdocs/html/>
    # disallow .htaccess, so webserver won't search for them
    AllowOverride None

    # funnel all requests to index.php
    # except requests for static resources
    RewriteEngine On
    RewriteRule !\.(js|ico|gif|jpg|png|css|html)$ index.php
</Directory>
```

Front controller bootstrap file: index.php

```
<?php
// minimum bootstrap file (can be many variations)

// explicit, full paths save the i5 time searching for files
$paths = array(
    realpath(dirname(__FILE__) . '/../library'),
    realpath(dirname(__FILE__) . '/../application'),
    realpath(dirname(__FILE__) . '/../application/models'),
    '.'
);
set_include_path(implode(PATH_SEPARATOR, $paths));

// Prepare the front controller
$frontController = Zend_Controller_Front::getInstance();

// Dispatch the request using the front controller
$frontController->dispatch();
```

Model-View- Controller

(Good structure for your
application)

Action Controller

- **Controller classes handle groups of request URLs**

`http://example.com/controller/action`

Default: `IndexController`

- Organizes and groups functionality
- One class (extending `Zend_Controller_Action`) for each controller

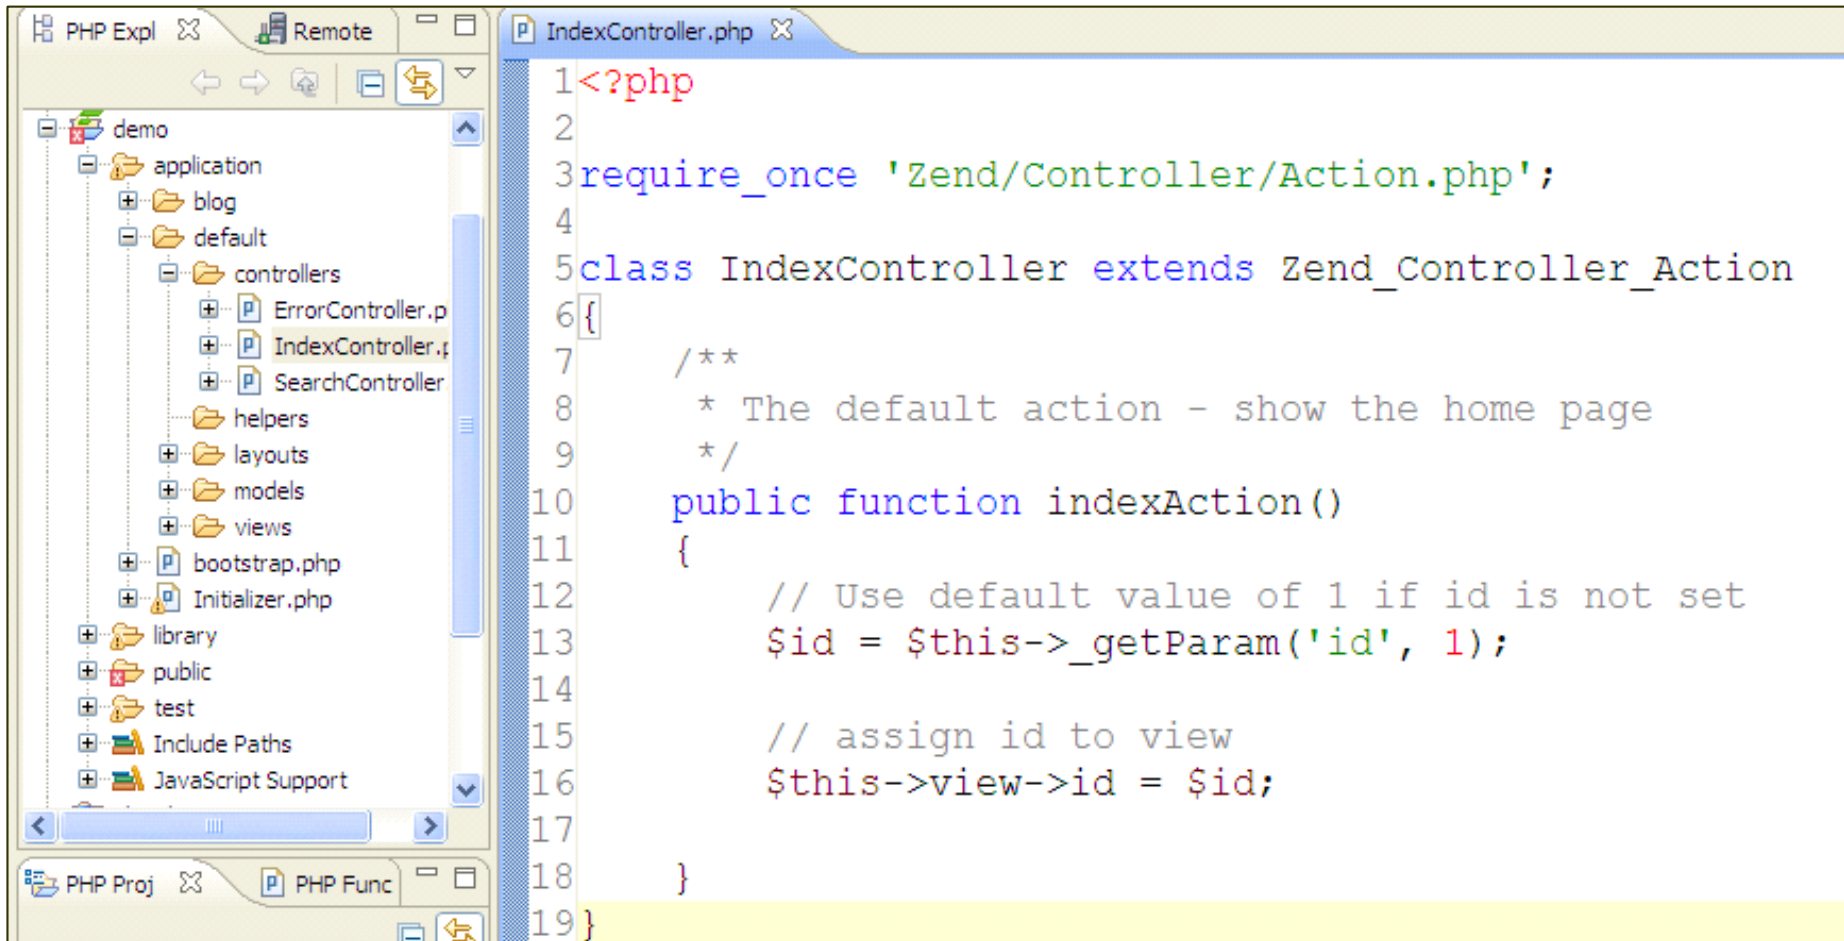

- **Action methods in each controller class handle requests**

`http://example.com/controller/action`

Default: `indexAction()`

- **Named like *actionAction()***
 - **Example: If *action* is “edit” then method is `editAction()`**

Controller example

```
1<?php
2
3require_once 'Zend/Controller/Action.php';
4
5class IndexController extends Zend_Controller_Action
6{
7    /**
8     * The default action - show the home page
9     */
10   public function indexAction()
11   {
12       // Use default value of 1 if id is not set
13       $id = $this->getParam('id', 1);
14
15       // assign id to view
16       $this->view->id = $id;
17
18   }
19}
```

Zend View

Scripts (templates)

- PHP-based script templates to present data
- Should contain only display logic, not business logic
- Default naming: “myaction.phtml”

Helpers

- Classes and methods that provide reusable view functionality
 - Examples of built-in view helpers: `escape()`, `formText()`, `partial()`, `partialLoop()`, `headTitle()`
 - Write your own, too

Layout

What View means to you

You can plunk HTML right into the view script and replace literals with PHP echo statements:

- `<?php echo $this->productNum ?>`

ZF provides smart defaults

- The `$this->escape()` view helper uses PHP's `htmlspecialchars()` function, recommended by most security experts.

My own view helper: TitleCase.php

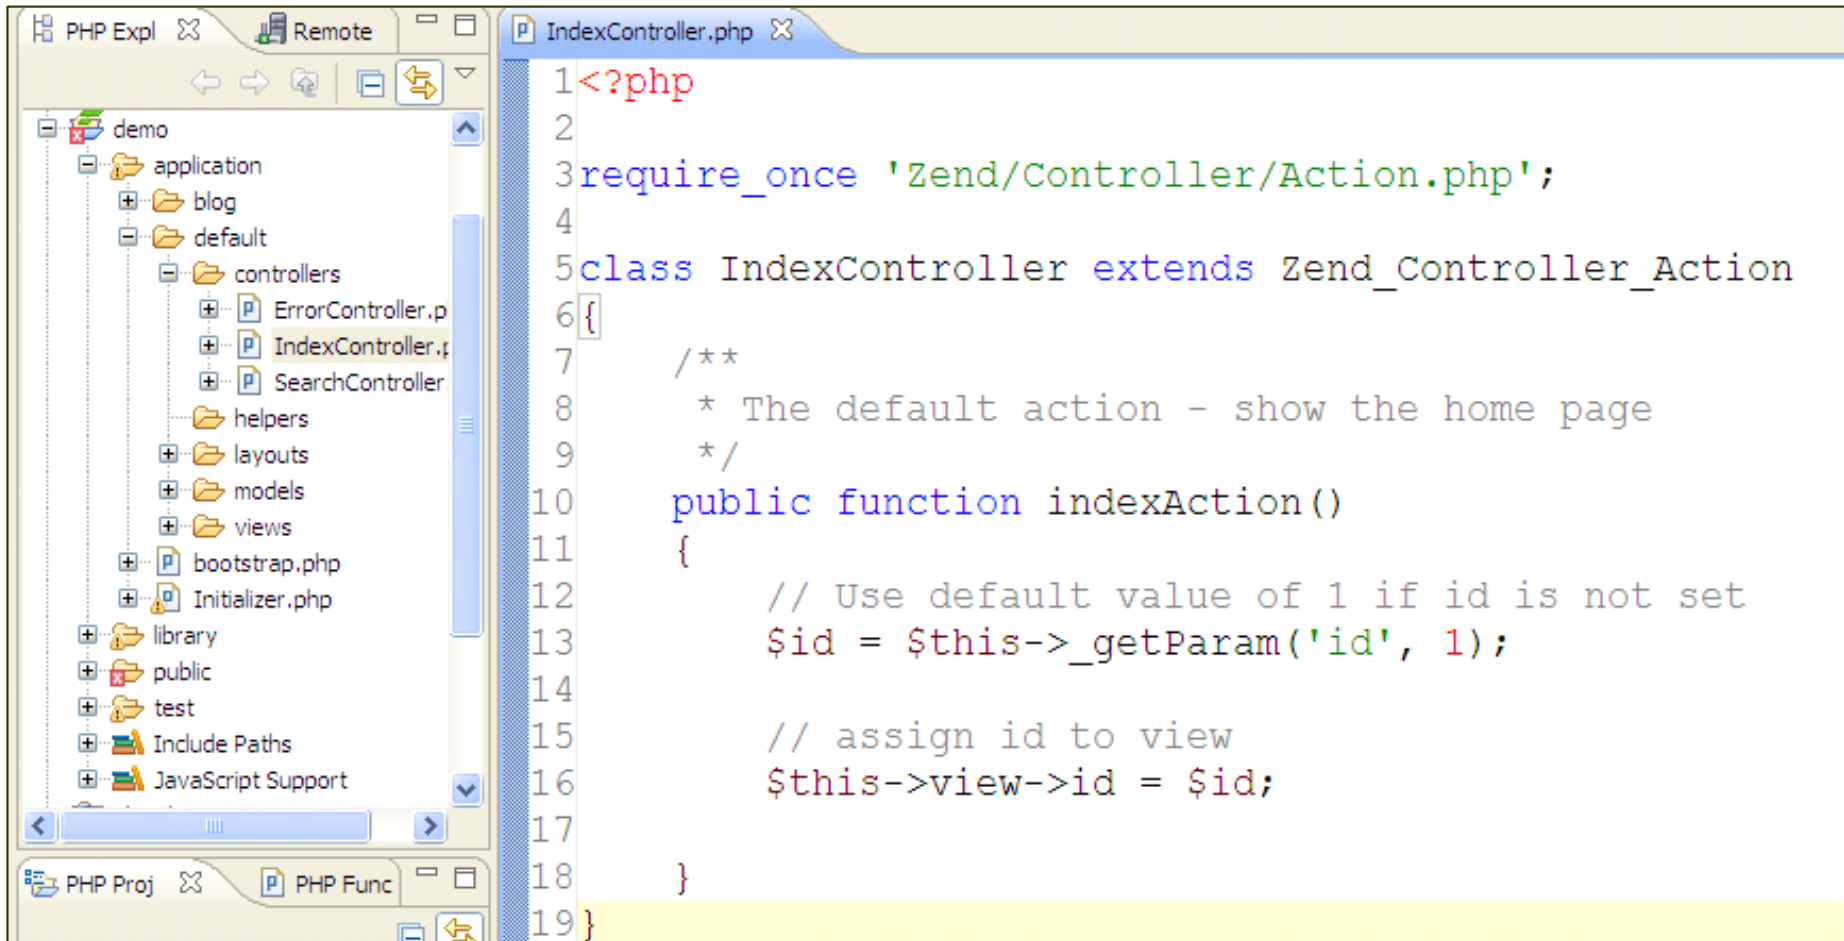

```
class Zend_View_Helper_Title_Case {  
  
    public $view;  
  
    public function titleCase($string = '')  
    {  
        return ucwords(strtolower(trim($string)));  
    } //(public function titleCase())  
  
    public function setView(Zend_View_Interface $view) {  
        $this->view = $view;  
    }  
}
```

Usage:

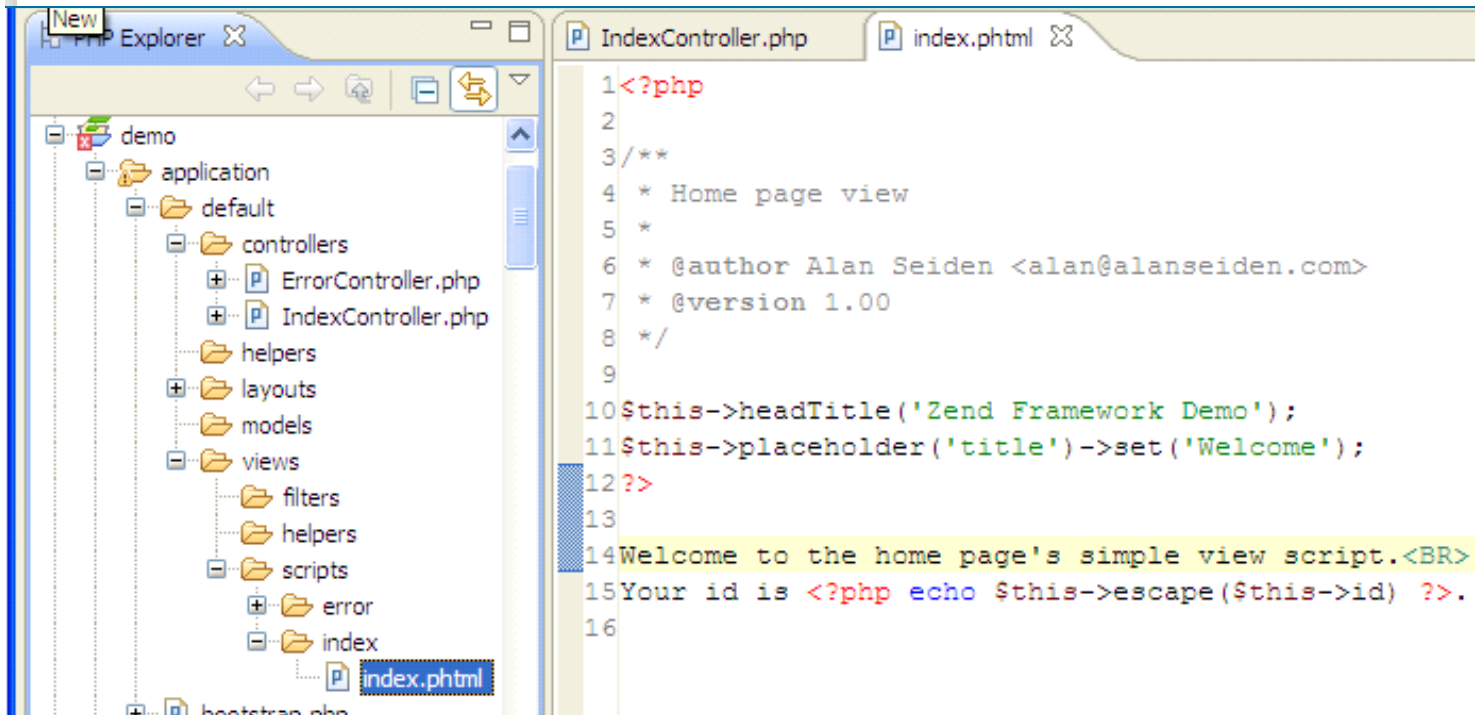

```
echo $this->titleCase('mozilla  
firefox');  
  
// Mozilla Firefox
```

Controller (again)...leads to view

```
1<?php
2
3require_once 'Zend/Controller/Action.php';
4
5class IndexController extends Zend_Controller_Action
6{
7    /**
8     * The default action - show the home page
9     */
10   public function indexAction()
11   {
12       // Use default value of 1 if id is not set
13       $id = $this->getParam('id', 1);
14
15       // assign id to view
16       $this->view->id = $id;
17
18   }
19}
```

View script automatically rendered

```
1 <?php
2
3 /**
4  * Home page view
5  *
6  * @author Alan Seiden <alan@alanseiden.com>
7  * @version 1.00
8  */
9
10 $this->headTitle('Zend Framework Demo');
11 $this->placeholder('title')->set('Welcome');
12 ?>
13
14 Welcome to the home page's simple view script.<BR>
15 Your id is <?php echo $this->escape($this->id) ?>.
16
```

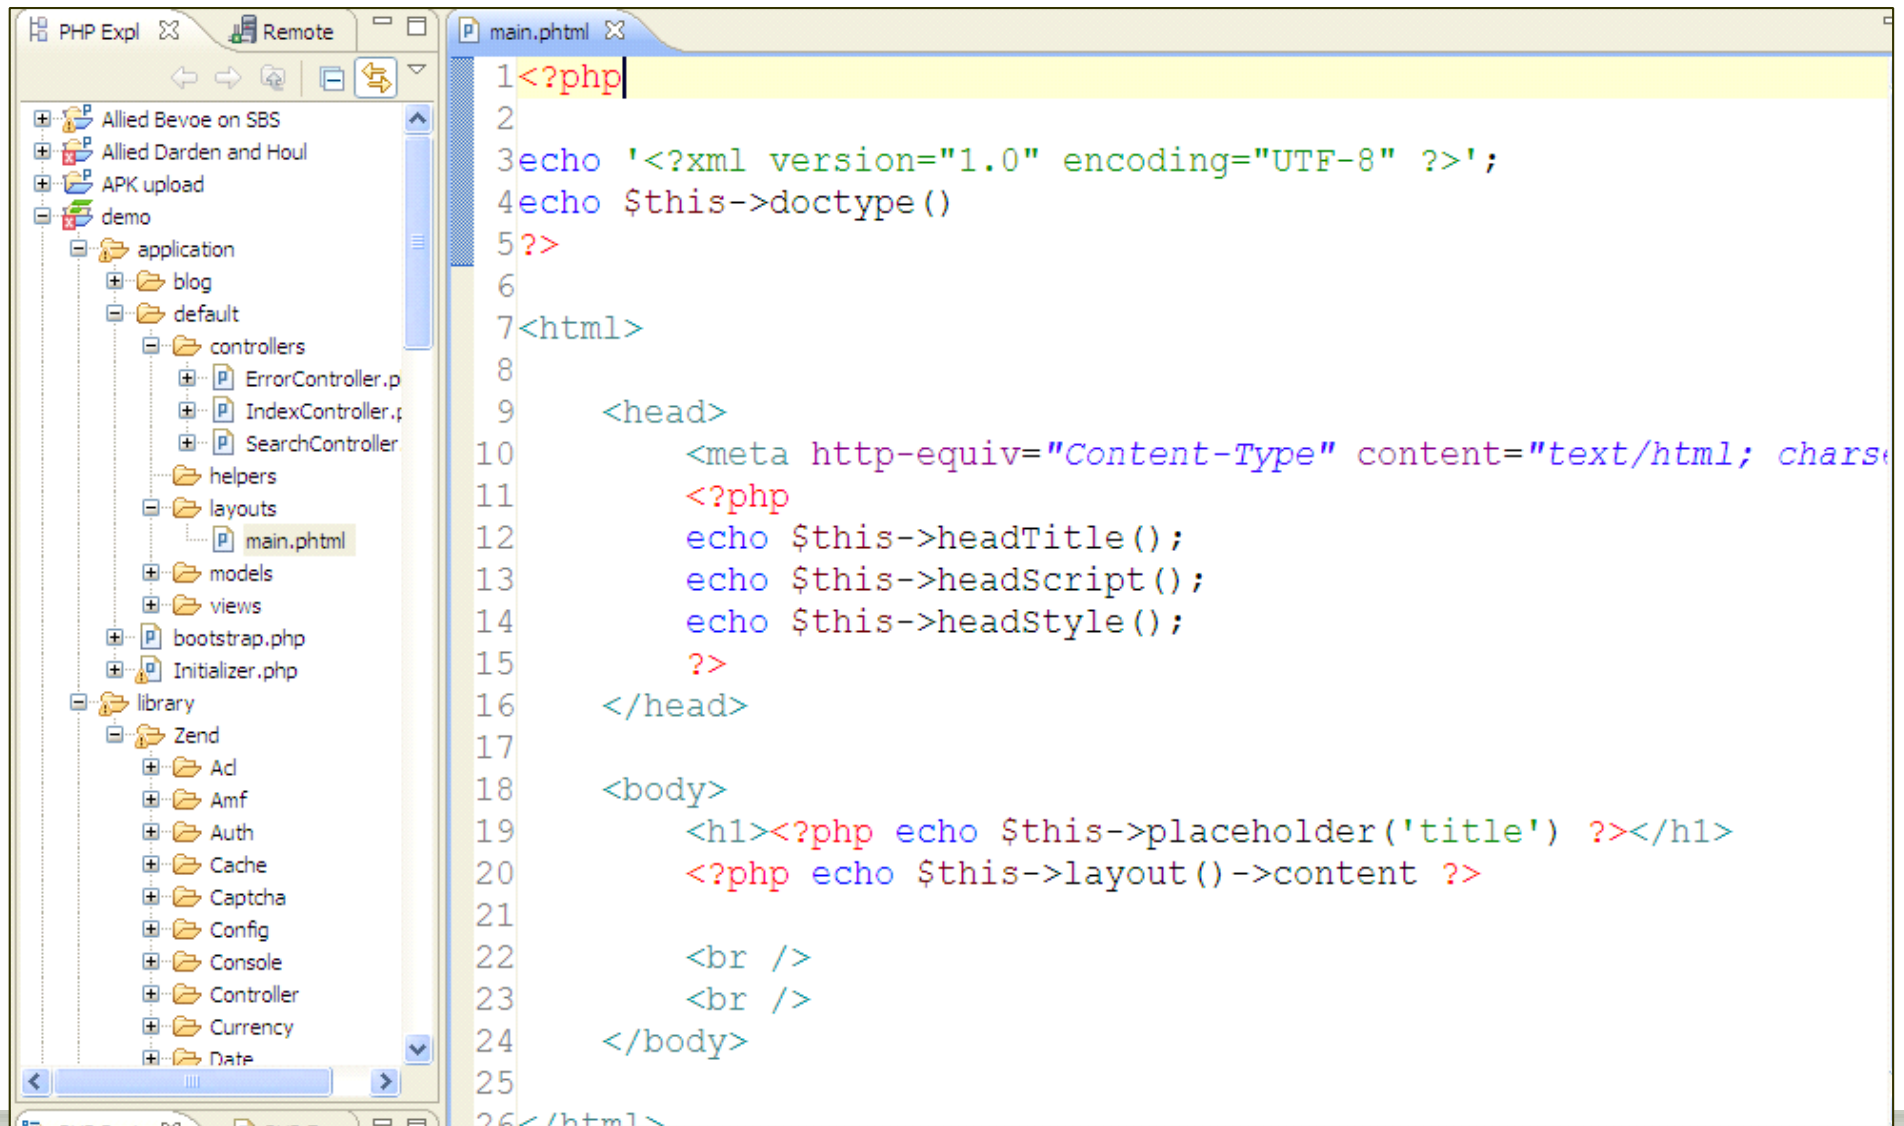

Zend Framework Demo	Zend Framework Demo
<p>http://localhost/zfdemo/</p> <p>Welcome</p> <p>Welcome the home page's simple view script. Your id is 1.</p>	<p>http://localhost/zfdemo/index/index/id/39</p> <p>Welcome</p> <p>Welcome to the home page's simple view script. Your id is 39.</p>

Zend_Layout

- **Gives your site a consistent look while retaining flexibility**
- **Two-step view pattern**
- **Placeholders useful for setting javascript, titles, other variable data**

Zend_Layout code

The image shows a screenshot of a web development environment. On the left, a file explorer displays the directory structure of a Zend Framework application. The 'application' directory is expanded, showing sub-directories like 'blog', 'default', 'controllers', 'helpers', 'layouts', 'models', and 'views'. The 'main.phtml' file is highlighted under the 'layouts' directory. On the right, the code for 'main.phtml' is displayed in a text editor. The code is as follows:

```
1 <?php
2
3 echo '<?xml version="1.0" encoding="UTF-8" ?>';
4 echo $this->doctype()
5 ?>
6
7 <html>
8
9     <head>
10         <meta http-equiv="Content-Type" content="text/html; charse
11         <?php
12         echo $this->headTitle();
13         echo $this->headScript();
14         echo $this->headStyle();
15         ?>
16     </head>
17
18     <body>
19         <h1><?php echo $this->placeholder('title') ?></h1>
20         <?php echo $this->layout()->content ?>
21
22         <br />
23         <br />
24     </body>
25
26 </html>
```

Model

Model

Model classes are abstract representations of data

- Can be extended from:
 - Zend_Db_Table – For database abstraction
 - Or any other class that fits your needs
 - Or build your own own abstract representations of your data

Model classes can contain business logic to prepare complex data for presentation

I stuff any “weird” code in models so that controllers/views are clean

Model example: "system busy" flag

```
// model: Busyflag.php

class Busyflag
{
    protected $name = 'SYSFLAGS'; // old-fashioned "System 36"
    table

    // isSiteUp: return true if up, false if down
    public function isSiteUp() {

        $sql = "select BZYFLG from {$this->name} where RECID = 'B'";
        $row = SBSDbhelp::getOneRow($sql);

        // true if Y, false otherwise.
        return $row['BZYFLG'] == 'Y';

    } // (public function isSiteUp())
} // (class Busyflag)
```

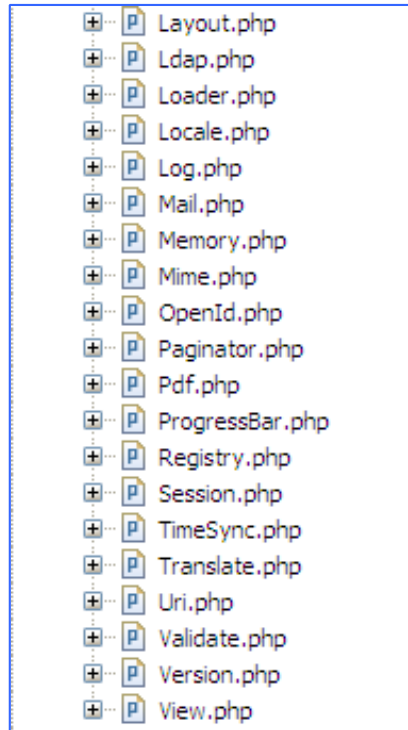

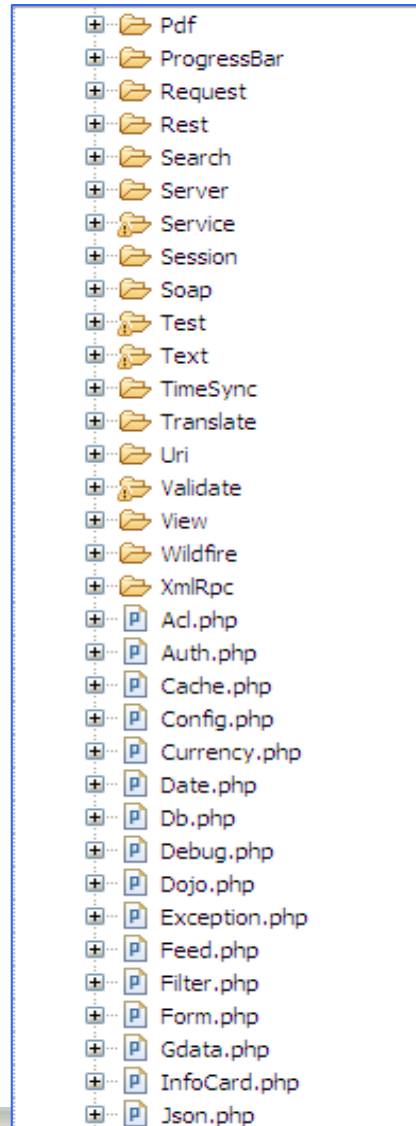

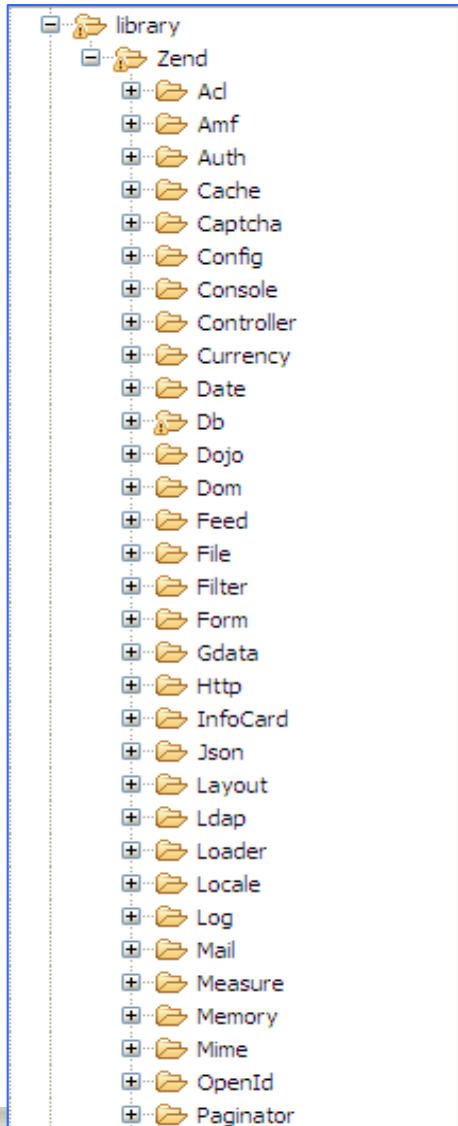

```
// usage (from a preDispatch front controller plugin)

$busyFlag = new Busyflag();
if (!$busyFlag->isSiteUp()) {
    // Take user to "site down" page.
} // (if (!$busyFlag->isSiteUp()))
```

Components included

Library of Zend components

Reminder:

Zend/Db.php = Zend_Db

Zend/Db/Table.php = Zend_Db_Table

Zend_Form component

Zend_Form

- **Creates the HTML for your data entry forms**
 - `$form = new Zend_Form();`
 - `$form->addElement('text', 'ordernum');`
 - `$form->addElement('text', 'date');`
- **Several ways to output form elements**
 - `echo $form; // (all elements) or`
 - `echo $form->ordernum; // (just ordernum) or`
 - `echo $form->getElement('ordernum');`
- **The HTML generated by that last echo**
 - `<input type="text" name="ordernum" id="ordernum">`

More complex Zend_Form example in MVC

```
// in a model:
class My_Form extends Zend_Form
{
    /* Create a text box that checks for non-letter characters
    ** and converts text to lower case on submission */
    $form->addElement('text', 'username', array(
        'validators' => array(
            'alnum',
            array('regex', false, '/^[a-z]/i')
        ),
        'required' => true,
        'filters' => array('StringToLower'),
    ));
}

// in a controller:
$form = new My_Form();
$this->view = $form

// in a view:
echo $this->form;
```

Real life example of Zend_Form

The screenshot displays a web browser window titled "Search Product Catalog - Mozilla Firefox". The page features a navigation bar with links for Home, Advanced Search, Orders, ABG Employee Connect, and Log out. A banner image shows a person in a suit, and the text "eBiz@ABG" is visible. A welcome message reads "Welcome, Angel Wong #105". The main content area is titled "Search Product Catalog" and includes a "PRICING MONTH: June 2009" indicator.

Bodegas Julian Chivite Navarra Reserva Coleccion 125	6784340	750 MI	6			5	3	NV		
Ca Montini Luna Di Luna Chardonnay/Pinot Grigio Gift Pack	4582449	750 MI	6			27	0	NV		1 cs: 149.99 149.99

Implementation of Product Id field

```
// AdvancedSearchForm class is a model:
class AdvancedSearchForm extends Zend_Form {

    $prodId = new Zend_Form_Element_Text("prodid",
        array('size' => 7, 'maxlength' => 7, 'class' =>
'width5'));
    $prodId->setRequired(false)
        ->addFilters(array("StripTags", "StringTrim"))
        ->addValidator(new Zend_Validate_Digits())
        ->setDescription("Partial product ID")
        ->setLabel("Code");

    $this->addElements(array($prodId));

} // (AdvancedSearchForm)
```

Zend_Db

database access

Database access with Zend_Db

Zend_Db can create SQL for you

- Fewer long, error-prone concatenated SQL strings

Zend_Db offers a lot beyond creating SQL

- consistent quoting
- escaping
- prepared statements (substitutions for “?”)
- profiler

Database access

Several classes give you a good start

- **Zend_Db_Adapter_Abstract**: uniform API for many RDBMS's
 - Zend_Db_Adapter_Db2
 - Zend_Db_Adapter_Pdo_Mysql
- **Zend_Db_Table**
 - Gateway class for doing queries on a given table
- **Zend_Db_Statement**
 - Specify SQL for “prepared” statement (secure--with ? marks)
- ...and more

Zend_Db_Table

Zend_Db_Table gives you record-level access similar to what you may be used to.

- Insert
 - `$products->insert(array(`
 `'prodid' => '1234567',`
 `'prodname' => 'sparkling water',`
 `);`
- Update
- Find (like chaining with a key)
 - `$results = $products->find('1234567');`
- Delete

Zend_Db techniques for IBM i

```
$driverOptions = array('i5_lib1' => 'MYLIB1, MYLIB2',
                      'i5_naming' => DB2_I5_NAMING_ON);

$config = array(
    'host'      => 'localhost',
    'username' => 'ALAN',
    'password' => 'secret',
    'dbname'   => 'SBSDB',
    'driver_options' => $driverOptions);

$db = Zend_Db::factory('DB2', $config);

// Using "select" method to select and display records
$rows = $db->select()->from('CUSTOMERS')
          ->where('CUSTNO >= 0');
// or write your own SQL with parameters
$sql = 'SELECT * FROM CUSTOMERS WHERE CUSTNO > ? and CUSTNO < ?';
$rows = $db->fetchAll($sql, array(100, 2000));

// either way, output results
foreach ($rows as $row) {
    echo $row['CUSTNO'] . ' ' . $row['CUSTNAME'];
}
```

Zend_PDF

```
<?php
// combine three TIFF images into a multi-page PDF
$images = array('/images/page1.tif', '/images/page2.tif', '/images/page3.tif');

$newFileName = '/pdf/full_document.pdf';

$pdf = new Zend_Pdf();

foreach ($images as $image) {

    // Create new page
    $pdfPage = $pdf->newPage(Zend_Pdf_Page::SIZE_A4);
    $image = Zend_Pdf_Image::imageWithPath($image);
    $pdfPage->drawImage($image, 10, 10, 400, 500);

    // add page to pdf
    $pdf->pages[] = $pdfPage;

} //(foreach ($images as $image))

// Save document as a new file
$pdf->save($newFileName);
```

Client classes for web services

- **Akismet**
- **Amazon**
- **Audioscrobbler**
- **Delicious**
- **Flickr**
- **Google Data**
- **Nirvanix**
- **ReCaptcha**
- **Simple**
- **SlideShare**
- **Strikelron**
- **Technorati**
- **Twitter**
- **Yahoo**

Zend_Service_Yahoo

Search the web with Yahoo

- Get your application ID from <http://developer.yahoo.com/wsregapp/>
- Class uses Zend_Rest_Client under the covers
- Returns Zend_Service_Yahoo_WebResultSet containing instances of Zend_Service_Yahoo_WebResult

```
$yahoo = new Zend_Service_Yahoo("YAHOO_APPLICATION_ID");
$results = $yahoo->webSearch('IBM PHP',
                             array('results' => '10',
                                    'start'    => 1));

foreach ($results as $result) {
    echo '<b>' . $result->Title . '</b> ' . $result->Url . '<br />';
}
```

Results from \$yahoo->webSearch
