IBM eServer iSeries

IBM

Notes: Overview

Management Central is a suite of systems management functions that began to appear with OS/400 Version 4 Release 3 (V4R3). It provided management capabilities built into base OS/400 and integrated into the iSeries Graphical interface, iSeries Navigator at no additional cost. The first functions included system monitors and system groups. In V4R4, it was greatly enhanced to enable long running, batch, scheduled or unattended operations for commands, packages, fix management and inventory. V4R5 ushered in the wireless and web enablement with Pervasive functions which included system availability and system monitors.

Today, it has expanded with enhancements to existing applications along with new applications from user administration, system value management, monitors and more. The interface has also been expanded with iSeries Access for Wireless introducing a companion for pervasive devices called iSeries Navigator for Wireless (a.k.a. MC-Pervasive)

Management Central uses the basic system operations on each of the endpoints (e.g., APIs for performance monitoring, system commands, etc.). Management Central does not place any limitation on the number of endpoint systems used by its functions. There will be practical limits determined by your environment, networks, management policies, etc.. In addition, there is no limit to the number of endpoint systems that can be in a group. Endpoints do not need to be at the same level as the Central System, nor does the Central System need to be at the same level as the Client, HOWEVER, Management Central is only as good as the client and Central System combination.

© 2003 IBM Corporation

IBM eServer iSeries

Notes: 10,000 Foot View

iSeries Navigator is the interface to the iSeries. It comes in 2 complimentary options: Windows and Wireless.

iSeries Navigator for Windows is installed on the PC so the user can have a rich graphical interface to interact with the systems.

iSeries Navigator for Wireless is a companion to Windows and provides a subset of the functionality via a web browser, internet enabled phone or personal data assistance (PDA).

Firewall - A firewall is optional but is recommended to accessing the functions via the wireless devices.

Web Application Server - Used to run the servlet for the Wireless functions. Examples would include Domino and WebSphere.

Central System connects to other systems (called endpoints) and store most management information.

Endpoints are just systems which your PC does not need to be in direct contact with in order to "manage".

Source System is from which objects, files and information are sent within Management Central's send tasks. The Source System is the source of the objects, files and information being sent.

Model System has all and only desired fixes installed or has all system values set properly for the targets.

Target Systems is where objects, files and information are sent within Management Central's send tasks. The Target Systems are the destinations of the objects, files and information being sent. Target Systems are often grouped into System Groups.

IBM eServer iSeries

IBM

Basics

Main View Terminology

The screenshot shows the iSeries Navigator window. On the left, a tree view displays the hierarchy of system components under 'Management Central (System1)'. On the right, a list view shows the selected components. Labels with arrows point to the following items in the tree view:

- Task** points to the 'Task Activity' folder.
- Scheduled Task** points to the 'Scheduled Tasks' folder.
- Definitions** points to the 'Definitions' folder.
- Monitors** points to the 'Monitors' folder.

© 2003 IBM Corporation

IBM eServer iSeries

IBM

Notes: Main View Terminology

Task - Asynchronous activity distributed over a group of endpoints that performs a specific action. A task is explicitly started or scheduled to start through user interaction and then runs through completion. It can only be explicitly changed while it is scheduled. It can also be explicitly canceled through user interaction.

- Commands
- Packages and Product
- Inventory
- Fixes (PTF management)
- Collection Services
- Users and Groups
- System Values

Scheduled Task - This is a regular task which the user wanted to run at a specified date and time. Once the scheduled task as run, it will be moved in with the other base Tasks.

Definition - Data and/or activity description that can be constructed, viewed and managed.

- Command Definition** - description and parameters of a command operation.
- Packages Definition** - a collection of objects and/or files grouped together for the purpose of distribution
- Product Definition** - a collection of objects and/or files grouped and formed as an installable product.
- User Definition** - a predefined user with attributes predefined. Other users can be created based on these user.

Monitor - Activity distributed over a group of endpoints that collects, presents and warns the user. A monitor can be explicitly started, changed and stopped through user interaction.

- System** - original monitors for performance
- Job** - monitors a specific criteria of jobs or servers
- Message** - monitors a specified message queue for a criteria of messages.
- File** - monitor for specified text strings, size or modification.

 - 95
 - 98
 - NT 4.0
 - 2000 Professional Client
 - XP (V5R1 see: APAR II12900)
 - ▶ iSeries NetServer or CD
 - ▶ CA/400 Directory
 - ▶ Custom or Full Option

© 2003 IBM Corporation

IBM eServer iSeries

IBM

Notes: Where Do I Get It?

iSeries Navigator, the interface to the iSeries, is included with OS/400 at no additional cost. The host OS/400 function is integrated into base OS/400. The client function is shipped as part of iSeries Access for Windows.

The connectivity general rule of thumb is that N-2 and N+2 releases are supported. However, the options available are only as current as good as the client and Central System combination. (i.e. if iSeries Navigator is at V5R3 and Central System at V5R1, only V5R1 functions will be shown)

Management Central is a technology integrated into iSeries Navigator and is not directly installed. When installing iSeries Access for Windows, choose 'Custom Install'. Expand the iSeries Navigator option tree and select the appropriate components such as Monitors, Commands.....

IBM eServer iSeries

IBM

Notes: What components do I need?

For this presentation, you will need at least the following:

- ✓ iSeries Navigator Base Support - Many things are included here for underlying support such as common dlls and jar files.
- ✓ Basic Operations - Message actions and ability to view spooled files
- ✓ Work Management - Job actions for job and system monitor menus
- ✓ Configuration and Services - Ability to view inventory directly, directly launch graph history from management collection objects
- ✓ File Systems- Ability to view and select items from the file system such as files and programs.
- ✓ Monitors- watches information about a system along with threshold notification and automation
 1. System - performance and system information such as CPU utilization and DASD
 2. Job - jobs performance information including individual and totals summary information such as CPU Utilization and number of jobs
 3. Message - messages on message queues for specified messages

© 2003 IBM Corporation

IBM eServer iSeries

IBM

Notes: System Monitors

iSeries Navigator System Monitors gather and present real-time performance data for your iSeries systems. You can use System Monitors to see your performance data as it happens. In contrast, you should use Graph History to see historical data saved on the system for more analysis. The data displayed in System Monitors and Graph History are both gathered from the data collected through Collection Services.

System Monitor graphs present system performance data in an easy-to-use graphical interface that you can directly manipulate to get more detailed data. They allow you to collect performance data simultaneously for a wide variety of system metrics, for any system or system group, and specific time intervals. Once you start a monitor, you are free to do other tasks. In fact, you could turn your PC off! It will continue to monitor your systems and perform any threshold commands or actions you specified. Your monitor will run until you decide to stop it. To effectively monitor real-time iSeries system performance, create a System Monitor.

At the first level of detail the performance data is manipulated to provide a graphical representation of the performance information and allows thresholds to be set. The second level of detail provides a list of items that account for the first level (ex. list of jobs). The third level of detail provides properties of a specific item in the second level.

System Monitors should NOT be used to drive history data collections. System performance data collections should be configured using Collection Services.

IBM eServer iSeries

IBM

Define A Monitor

Select 'New Monitor...' and specify General properties

The screenshot shows the iSeries Navigator interface. On the left, a tree view shows the 'Monitors' folder expanded. A context menu is open over the 'Monitors' folder, with 'New Monitor...' highlighted. A red arrow points from this menu item to a 'New Monitor' dialog box. The dialog box has tabs for 'General', 'Metrics', 'Actions', and 'Systems and Groups'. The 'General' tab is active, showing fields for 'Name' (CPU Average) and 'Description' (Example of CPU Average being monitored). The 'Monitors' table in the background shows a 'Sample CPU Monitor' with a status of 'Stopped'.

© 2003 IBM Corporation

IBM eServer iSeries

IBM

Notes: Define a Monitor

You need to name your monitor, suggest it be something very specific. You can select one or multiple metrics in a single monitor

Question: How many metrics do you put in a single monitor?
 Answer: It depends

1. do you like to see all monitors on a single screen?
2. do you prefer to have more granular monitor notifications

There is no limit on the number of endpoint systems that a monitor can be started on. However you do get into usability issues when displaying the graph, too many systems on a graph and it might get to difficult to view.

General - The General page for New Monitor or Monitor Properties allows you to view and change general information about the monitor. The general information includes the name of the monitor, a brief description of the monitor.

Name - The unique name of the monitor. You can change the name, using up to 64 characters for the new name. Do not use any of the following characters: asterisk (*), backslash (\), colon (:), greater than (>), less than (<), question mark (?), quotation mark ("), slash (/), or vertical bar (|).

Description - A brief description to help you identify this monitor in a list of monitors. You can change the description, using up to 64 characters for the new description.

© 2003 IBM Corporation

IBM eServer iSeries

IBM

Define A Monitor

Select 'Metrics to monitor' and press OK to create

What

Available metrics:

- CPU Utilization (Interactive Jobs)
- CPU Utilization (Interactive Feature)
- CPU Utilization (Database Capability)
- CPU Utilization (Secondary Workloads)
- CPU Utilization Basic (Average)
- Interactive Response Time (Average)
- Interactive Response Time (Maximum)
- Transaction Rate (Average)
- Transaction Rate (Interactive)
- Batch Logical Databases I/O

Metric to monitor:

- CPU Utilization (Average)

General | Threshold 1 | Threshold 2

Collection interval: 1 minute

Maximum graphing value: 100 percent busy

Display time: 5 minutes

© 2003 IBM Corporation

IBM eServer iSeries

Notes: Define A Monitor

The Metrics page for New Monitor or Monitor Properties allows you to select the metrics that you want to monitor. You can view and change information about the collection interval, the maximum graphing value, and the display time for each metric. You can also click Threshold 1 or Threshold 2 to specify information about the thresholds for each metric.

Metrics is the piece of information to collect. Possible values are:

CPU Utilization (Average)	Communications IOP Utilization (Average)
CPU Utilization (Interactive Jobs)	Communications IOP Utilization (Maximum)
CPU Utilization (Interactive Feature)	Communications Line Utilization (Average)
CPU Utilization Basic (Average)	Communications Line Utilization (Maximum)
CPU Utilization (Secondary Workloads)	LAN Utilization (Average)
CPU Utilization (Database Capability)	LAN Utilization (Maximum)
Interactive Response Time (Average)	Machine Pool Faults
Interactive Response Time (Maximum)	User Pool Faults (Average)
Transaction Rate (Average)	User Pool Faults (Maximum)
Transaction Rate (Interactive)	Disk Storage (Average)
Batch Logical Database I/O	Disk Storage (Maximum)
Disk Arm Utilization (Average)	Disk IOP Utilization (Average)
Disk Arm Utilization (Maximum)	Disk IOP Utilization (Maximum)

Collection Interval is the time to wait in-between each collection of data.

Maximum graphing value is the highest value to be displayed on the vertical axis of the graph.

Display time is how many minutes you want displayed on the horizontal axis of the graph.

IBM eServer iSeries

Start A Monitor

Select the monitor, then the start button to select systems/groups

The screenshot shows the iSeries Navigator application window. The 'Monitors' pane on the left shows a tree view with 'CPU Average' selected. The 'Start CPU Average' dialog box is open, showing 'Sue's Group' selected in both the 'Available systems and groups' and 'Selected systems and groups' panes. The 'Start' button in the main window is circled in red, and a red arrow points to the dialog box.

© 2003 IBM Corporation

IBM eServer iSeries

IBM

Notes: Start A Monitor

The Start Monitor dialog allows you to select the endpoint systems and system groups on which you want to start the monitor.

To add a system or group to the Selected systems and groups list, select it in the Available systems and groups list, and then click Add. If a monitor is started and a system is added, the system will be sent the monitor and start it automatically.

To remove a system or group from the Selected systems and groups list, select it in the list, and then click Remove. If a monitor is started and a system is removed, the system will have the monitor stopped automatically from the system.

Available systems and groups - A list of endpoint systems and system groups from which you can select a system or group. Click the plus sign (+) next to any group to see the systems that are included in the group.

Monitor data is collected and stored on the endpoint system. A minimum amount of data is actually sent back to the client when viewing the graph, The more specific, detailed data is only sent to the client when the graphs are open

PC is not required to be connected once monitor is started. The graph window can also minimized and the monitor will still be active.

The data shown in the graph is obtained from Collection Services. Collection Services houses the data in management collection objects. This data is used by system monitors, job monitors and other performance tools.

IBM eServer iSeries

IBM

View A Monitor

Status

The screenshot shows the iSeries Navigator interface. The 'Monitors' pane is open, showing a 'CPU Average' monitor. The 'Status' dialog is displayed, showing the overall status as 'Started'. The dialog also lists the systems and groups being monitored:

System or Group	Status
Sue's Group	Started
System1	Started
System2	Started
System3	Started

At the bottom of the dialog, there is a button labeled 'Restart on Failed Systems'. A red arrow points to this button with the text 'Easily restart failed'.

© 2003 IBM Corporation

IBM eServer iSeries

IBM

Notes: View A Monitor - Status

The Status dialog allows you to see the current status of each endpoint system and system group associated with a monitor. The status of each system and group is updated automatically as changes occur. You can expand any group in the System or Group list to see the status of individual systems in the group. By clicking the Restart button, you can restart the monitor on any systems on which it has failed.

Overall status - The current status of the monitor. Possible values are:
 x thresholds triggered - The number of thresholds that are currently active for the monitor (that is, x represents the number of thresholds that have been triggered, but have not been reset).
 Started on x of y systems - The monitor is collecting data on x of y endpoint systems, where x represents the number of systems where the monitor is running and y represents the number of systems where you requested to start the monitor. The monitor is in the process of starting on the remaining systems.
 Started - The monitor is collecting data on all endpoint systems where you requested to start the monitor.
 Starting - The monitor is in the process of starting.
 Stopping - The monitor is in the process of stopping.
 Stopped - The monitor is no longer collecting data.
 Failed - An attempt was made to start the monitor on the specified systems or groups, but the monitor was not started on any systems. The failure may have occurred because the systems were not running when you tried to start the monitor, or it may be because a connection was lost or a server was not started. (See Starting the Management Central server.) Click Restart to try starting this monitor again.
 Failed on x of y systems - The monitor has failed to start or unexpectedly stopped work on x of y systems (where x is the number of systems on which work has stopped and y is the total number of systems on which the monitor is to be run). The monitor is starting or started on the remaining systems. The failure may have occurred because the systems were not running when you tried to start the monitor, or it may be because a connection was lost or a server was not started. (See Starting the Management Central server.) Click Restart to try starting this monitor again. See the System or Group Status for a list of the endpoint systems and system groups associated with the monitor and the current status of each system and group.

Notes: View A Monitor - Metric Data

Monitor window shows a graphical view of the metrics for a monitor as they are being collected. You can have more than one Monitor window open at the same time, and you can work with other windows while the Monitor windows are open. You can minimize the Monitor window and be informed by an audible or visible alarm when important thresholds are reached. The Monitor window contains three panes.

Graphs - Each endpoint system is represented by a unique graph line. Click the legend icon in the lower right corner of any graph to see which system is represented by each line. You can change the color, width, or style of the line for each system in the User Preferences dialog by clicking Options from the menu bar on the AS/400 Operations Navigator window.

You can change the size of the Graphs pane, and you can change the size of any Monitor graph. You can arrange the Monitor graphs to suit your needs.

Click the icon in the right-hand corner of the title bar of any Monitor graph to minimize the graph to just the title bar. Click the icon again to restore the graph to its previous size.

IBM eServer iSeries

IBM

Notes: Setting Threshold

Threshold - A threshold is a setting for a metric that is being collected by a monitor. This setting allows you to specify actions to be taken when a specified value (called the trigger value) is reached. You can also specify actions to be taken when a second value (called the reset value) is reached. For example, you can specify an OS/400 command that stops any new jobs from starting when CPU utilization reaches 90% and another OS/400 command that allows new jobs to start when CPU utilization falls to less than 70%. You can also choose to add an event to the Event Log whenever the trigger value or the reset value is reached. You can set up to two thresholds for each metric that the monitor is collecting. Trigger - considered bad (usually high but can be low), reset - consider good (opposite of trigger)

The two Thresholds tabs on the metrics page provide a place for you to specify whether or not you want to monitor this metric for a particular threshold. You must check the Enable threshold box before you can specify the conditions to trigger and to reset this threshold. You can also specify the action to be taken when the threshold is triggered and when it is reset. The action that you specify must be an OS/400 command. When you click OK, this metric will be actively monitored for this threshold if the monitor is currently running. If the monitor is not currently running, this metric will be monitored for this threshold the next time the monitor is started

You can specify the following conditions and commands for Threshold trigger and for Threshold reset:

- Value - Specifies the condition that must be met to trigger or to reset this threshold.
- Duration - Specifies the number of consecutive collection intervals that the value must meet the criterion to cause a threshold trigger or reset event. Specifying a higher number of collection intervals for Duration helps to avoid unnecessary threshold activity due to frequent spiking of values.
- OS400 command - Specifies the command to be run on the iSeries host system when the threshold is triggered or reset.

© 2003 IBM Corporation

IBM eServer iSeries

Notes: Setting Threshold

System Monitor Replacement Variables:

Parameter	Passed Data
&DATE	The Date the monitor triggered or reset
&INTVL	Collection interval: How often the monitor collected data (in seconds)
&MON	The Monitor name
&RDUR	Reset duration: How many intervals does the reset value have to be met before the monitor resets.
&RVAL	Reset value: The value that the metric was monitoring for when the monitor reset
&SEQ	Sequence number: A unique, incrementing number assigned to each collection interval. Can be used in a program to compare when triggers happened and in what sequence.
&TDUR	Trigger duration: How many intervals does the trigger value have to be met before the monitor triggers
&TIME	The time the monitor triggered or reset
&TVAL	Trigger value: The value that the metric was monitoring for when the monitor triggered
&VAL	Current value: The actual value of the metric when the monitor triggered (2)

Note: A couple of things to note about system monitor replacement parameters:

- The dollar sign (\$) that was available in previous releases is still supported, for example, \$TIME.
- The wording is a bit different on some metrics and values:
- Batch I/O is shown as I/O operations rather than transactions per second.
- Transaction rates are shown as transactions rather than transactions per second.
- Interactive response times (both average and maximum) are shown in milliseconds rather than seconds.

IBM

Changing Thresholds

Properties

Active Control

Menu

© 2003 IBM Corporation

IBM eServer iSeries

IBM

Notes: Changing Thresholds

You can change the thresholds several ways.

- Properties
- Active graphical control
- Menu items

You can change thresholds while a monitor is started, e.g., you do not need to stop the monitor to change the thresholds. The general properties of the monitor can be accessed via the toolbar or menu items for making any changes or additions to the thresholds and values.

To change the trigger value or the reset value for a threshold using the active graphical control, place the mouse pointer on the threshold indicator. When the ToolTip indicates Trigger, hold the mouse button down and move up or down to change the trigger value. The changing values are shown in the ToolTip. When the ToolTip indicates Reset, hold the mouse button down and move up or down to change the reset value. Click any collection point on a Monitor graph line to see Details of the data associated with the collection point.

By accessing the menu items, you will be taken directly to the thresholds page in properties to make any changes.

There are several visual indicators when a threshold occurs:

- Status in the toolbar area.
- Upper Left corner icon will change.
- Line in the graph will change to red.
- Metric graph title will change to red with icon indicator

Sound alarm:	<input type="checkbox"/>	<input type="checkbox"/>

OS400

PC Client

© 2003 IBM Corporation

IBM eServer iSeries

IBM

Notes: Threshold Actions

The Actions page for Monitor Properties allows you to specify the actions to occur when a threshold is triggered and when a threshold is reset which apply to all metrics.

Log event - Adds an entry to the Event Log on the central system indicating that the threshold was triggered. The entry also includes the date and time the event occurred, the endpoint system being monitored, the metric being collected, and the monitor that logged the event.

Open Event Log - Displays the Event Log, which is a list of threshold trigger and reset events that have occurred.

Open monitor - Displays a graphical view of the metrics as they are being collected.

Sound alarm - Sounds an alarm on the PC.

Threshold commands will be run under the monitor's owner's user profile.

When a threshold gets triggered/reset, your PC client does not need to be up and running to run the OS400 command. However, if it is not up the corresponding PC action will not happen.

© 2003 IBM Corporation

IBM eServer iSeries

Viewing Events From Thresholds

The screenshot shows the iSeries Navigator application window. The 'System Event Log' window is open, displaying a table of events. A red circle highlights the 'Event' column header in the table. The table contains the following data:

Event	Date	Time	System	Metric
Trigger	5/4/2002	7:10:01 PM	System3	CPU Utilizati
Reset	5/4/2002	7:09:30 PM	System3	CPU Utilizati
Trigger	5/4/2002	7:08:45 PM	System3	CPU Utilizati
Trigger	5/4/2002	7:07:00 PM	System3	CPU Utilizati
Reset	5/4/2002	7:05:30 PM	System3	CPU Utilizati
Trigger	5/4/2002	7:03:01 PM	System3	CPU Utilizati
Reset	5/4/2002	7:01:15 PM	System3	CPU Utilizati
Trigger	5/4/2002	6:59:46 PM	System3	CPU Utilizati
Reset	5/4/2002	6:59:01 PM	System2	CPU Utilizati
Trigger	5/4/2002	6:58:46 PM	System2	CPU Utilizati
Reset	5/4/2002	6:58:46 PM	System3	CPU Utilizati
Trigger	5/4/2002	6:57:46 PM	System3	CPU Utilizati
Reset	5/4/2002	6:57:30 PM	System3	CPU Utilizati
Trigger	5/4/2002	6:54:46 PM	System3	CPU Utilizati

© 2003 IBM Corporation

IBM eServer iSeries

Notes: Event Logs

The Event Log window displays a list of threshold trigger and reset events for all of your monitors. You can specify on the Properties page for each monitor whether or not you want events added to the Event Log. To see the Properties page for any monitor, select the monitor in the Monitors window and then select Properties from the File menu. The list of events is arranged in order by date and time by default, but you can change the order by clicking on any column heading. For example, to sort the list by the endpoint system where the event occurred, click on System.

An icon to the left of each event indicates the type of event:

- A red circle with white x - indicates that this event is a trigger event for which you did not specify a host command to be run when the threshold was triggered.
- A yellow circle with red x - Indicates that this event is a trigger event for which you specified a host command to be run when the threshold was triggered.
- A white check with a check mark - indicates that this event is a threshold reset event.

You can customize the list of events to include only those that meet specific criteria by selecting Options from the menu bar and then selecting Include. You can have more than one Event Log window open at the same time, and you can work with other windows while the Event Log windows are open. Event Log windows are updated continuously as events occur.

Notes: Options - Include

Options menu choices

Click Options on the menu bar to display the actions you can perform to change what information is displayed. The possible choices are:

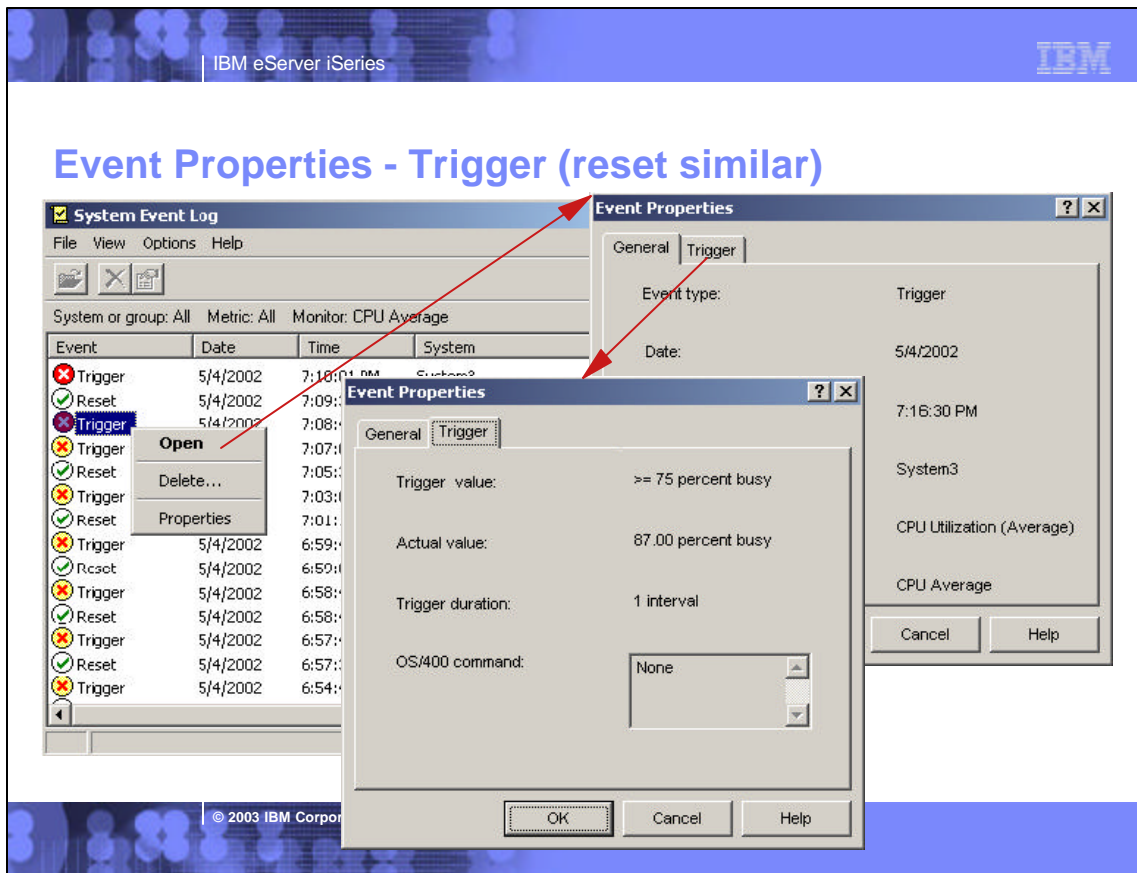

Include...

Displays the Include dialog, which allows you to specify which events you want to display in the list.

Columns...

Displays the Columns dialog, which allows you to specify which columns of information you want to display in the list. You can also specify the order in which you want the columns to be displayed.

© 2003 IBM Corporation

Notes: Event Properties

The Trigger/Reset page for Event Properties allows you to view additional information about the event. This information includes the value, the duration, the OS400 command and the sequence number of the event.

Trigger/Reset value - The value specified in the monitor properties.

Actual value - The actual value that exceeded the trigger value and caused the trigger event.

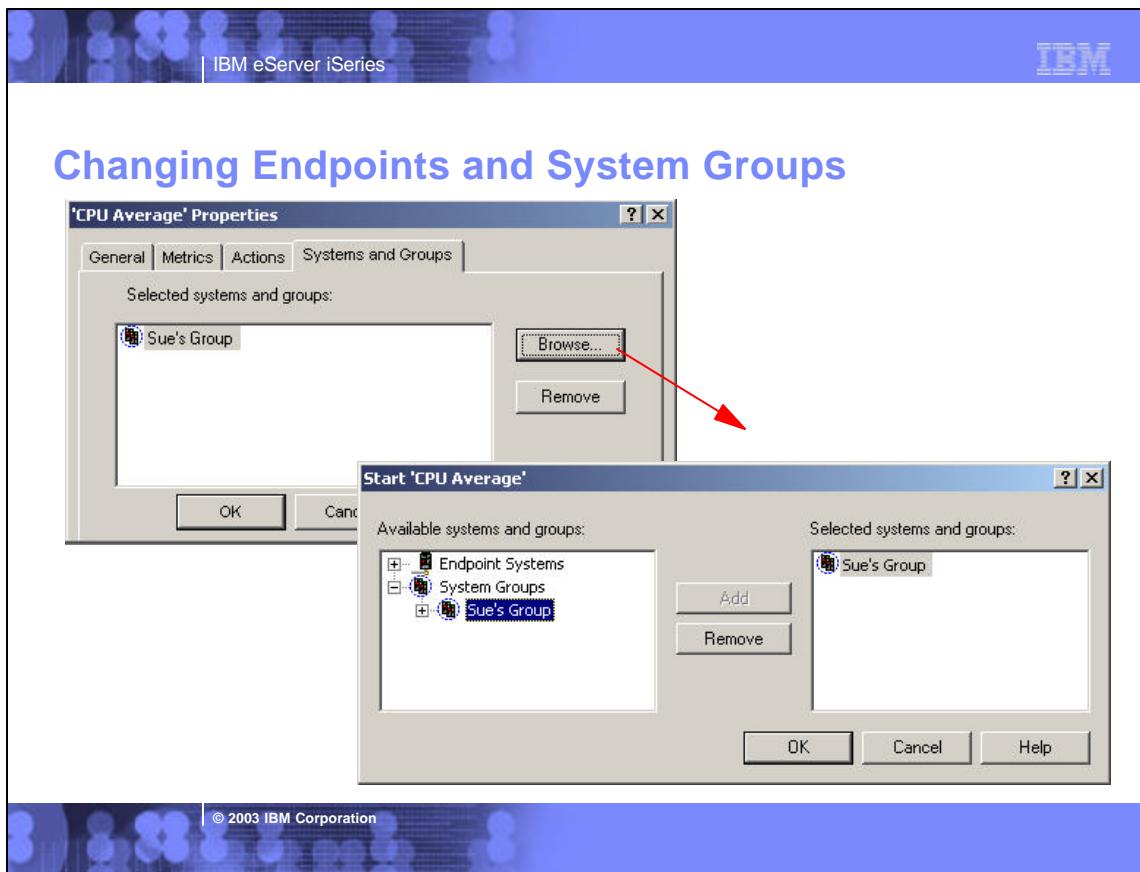

Duration - The number of collection intervals specified for the duration in the monitor properties.

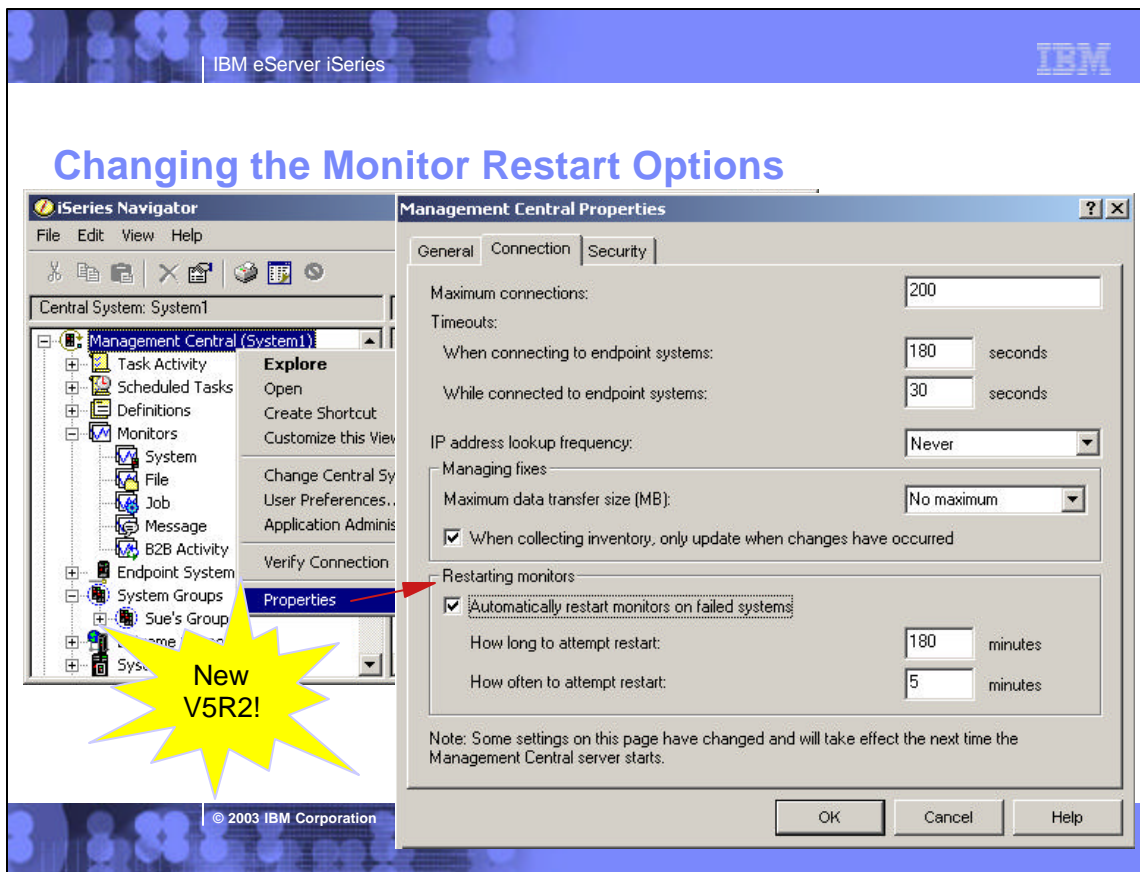

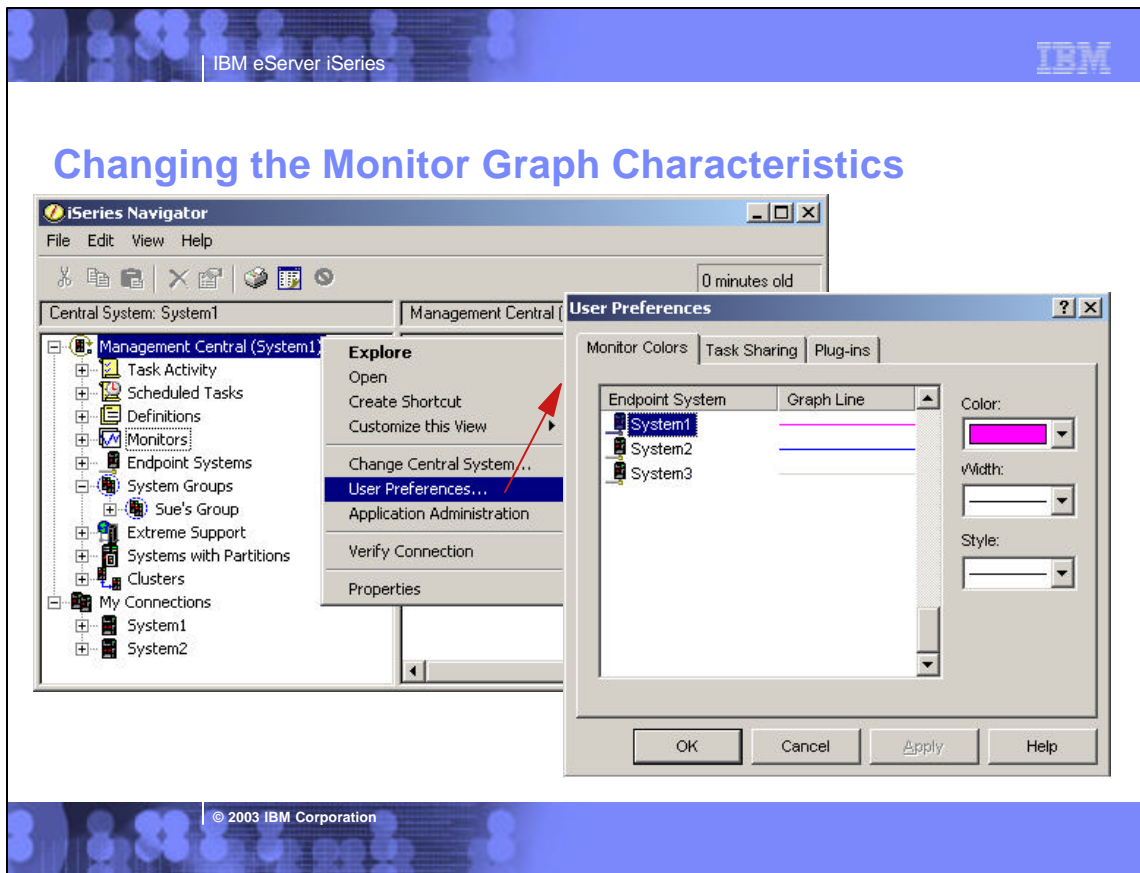

OS400 command - The command that was run on the endpoint system when the event occurred.

The General page for Event Properties allows you to view general information about the event. The general information includes the type of event (trigger or reset), the date and time the event occurred, the endpoint system that the event occurred on, the metric that was being collected, and the name of the monitor that logged the event.

For more information, select the following:

Event type	System
Date	Time
Monitor	Metric

IBM eServer iSeries 

Notes: Changing the Monitor Restart Options

Restarting Monitors (new for V5R2)

Monitor Restart was added to provide a way to automatically restart monitors when the Management Central servers have been interrupted. These interruptions could be as simple as the Central Server or Endpoint Server being restarted, or something more dramatic such as the temporary loss of communications between the Central Server and an Endpoint Server or a system being IPLed.

If you select to have the system automatically attempt to restart you monitors, you may also specify how long you want the central system to keep trying to restart the monitors and how often you want the system to try during that time period.

For example, if you want the system to try to restart monitors every five minutes for a period of 3 hours, you select 'Automatically restart monitors on failed systems' and then specify 180 minutes for 'How long to attempt restart' and 5 minutes for 'How often to attempt restart'.

A change to this setting takes effect the next time the Management Central servers are restarted.
All Monitors support the restart option.

Default behavior is OFF.

Collection Services

© 2003 IBM Corporation

IBM eServer iSeries

IBM

Notes: Collection Service

With Collection Services you can collect performance data for future analysis by the Performance Tools for AS/400 licensed program (5722-PT1) or other performance report applications. You can also use the data collected through Collection Services to create graph and summary data displayable through iSeries Navigator using Graph History.

To collect and store performance data for future analysis, you can start Collection Services on a single system or you can start Collection Services on system groups. You can use performance data to make adjustments to programs and operations. These adjustments can improve response times and throughputs and help your systems reach their peak performance.

Collection Services collects data that identifies the relative amount of system resource used by different areas of your system. When you collect and analyze this information on a regular basis, you help balance your resources better, which in turn gets you the best performance from your system. You can customize your data collections so you collect only the data you want.

You must use Collection Services to collect your data and create database files. Collection Services stores your data for each collection in a single collection object, from which you can create as many different sets of database files as you need. You can use the database files with 5722-PT1 or other applications to produce performance reports. Collection Services deletes only cycled collection objects. A status of Cycled means that Collection Services has stopped collecting data and storing it in the object. You can specify Permanent if you do not want Collection Services to delete your collection objects for you.

IBM eServer iSeries

IBM

Start Collection Services

The screenshot shows the iSeries Navigator interface. On the left, a tree view shows a hierarchy of system objects, including 'Management Central (System1)', 'Task Activity', 'Scheduled Tasks', 'Definitions', 'Monitors', 'Endpoint Systems', 'System Groups', 'Sue's Group', 'Extreme Support', 'Systems with Partitions', 'Clusters', 'My Connections', 'System1', and 'System2'. The 'Sue's Group' object is selected. A context menu is open over 'Sue's Group', showing options like 'Open', 'Create Shortcut', 'Run Command...', 'Users and Groups', 'Inventory', 'Monitors', 'Fixes', 'Collection Services', and 'System Values'. The 'Collection Services' option is expanded, showing sub-options: 'Start Collecting...', 'Stop Collecting...', and 'Status'. The 'Start Collecting...' option is highlighted. The main pane on the right shows a table with columns 'Name' and 'Description', listing various system components and their functions.

Name	Description
Task Activity	Work with active tasks
Scheduled Tasks	View and work with sc
Definitions	Create and manage d
Monitors	Monitor and view real
Endpoint Systems	Create, delete, and m
System Groups	Create, delete, share,
Extreme Support	Contains service and e
Systems with Partitions	Configure and manage
Clusters	Configure and manage

Start Collection Services - General

The screenshot shows the 'Start Collection Services - Sue's Group' dialog box with the following settings and annotations:

- Apply changes:** Points to the 'Cycle if already collecting' checkbox.
- Create a new object:** Points to the 'Cycling' section, specifically the 'Cycle everyday at' time field.
- Time between collections:** Points to the 'Default collection interval for detailed data' section, specifically the '15 minutes' selection.
- Time to keep objects:** Points to the 'Collection retention period' section, specifically the '1 day' selection for 'Detailed data'.
- Additional formats:** Points to the 'Create graph data when collection is cycled' and 'Create summary data when collection is cycled' checkboxes.

© 2003 IBM Corporation

IBM eServer iSeries

Notes: Start Collection Services - General

General properties to specify general information about the collection of iSeries performance data. The values shown on this page are the values stored on the iSeries. Changes made to the values on this page will change the values stored on the iSeries. Changes to the Default collection interval and the Collection retention period become effective immediately (that is, they are applied to the current collection of data). Other changes become effective when you cycle collection. When you change any Collection Services Properties and click OK, you will be asked if you want to cycle collection at that time.

Cycle if already collecting - Select this if you want to cycle the collection on systems where Collection Services is started.

Location to store collections - The path where the collection objects are stored on the system. This is a read-only field.

Cycling - When a collection is cycled, no more data is added to the collection object and a new collection object is created to store newly collected data.

Default collection interval for detailed data - The value that determines the collection interval for any category that does not have a specific collection interval defined.

Collection retention period - The length of time that collection objects remain in the file system before they are deleted.

Default Retention Period - Length of time raw performance collection object data will remain on the system

Graph Retention Period - Length of time detailed performance data is available to be viewed through Graph History

Summary Retention Period - Length of time summarized performance data is available to be viewed through Graph History

Create database files during collection - Select this to generate database files automatically as data is collected.

Create graph data when collection is cycled - Select this to generate detailed graph data automatically when data is collected.

Create summary data when collection is cycled - Select this to generate summary data automatically when data is collected.

Data profile needed

Specific data categories

Frequency (per category)

IBM eServer iSeries

IBM

Notes: Start Collection Service - Data To Collect

When you click OK, a Start Collection Services task is created. You can select the task under Task Activity in the Operations Navigator window and view the status of the task on any system or group. When the start task has completed, Collection Services begins collecting performance data and storing it in the collection object specified.

When you click Schedule, you can specify how often you want to run the Start Collection Services task and when you want the task to start. A Start Collection Services task is scheduled. You can select the task under Scheduled Tasks in the Operations Navigator window and view the status of the task on any system or group. When the start task has completed, Collection Services begins collecting performance data and storing it in the collection object specified.

Management Central Collection Services provides an easy, new way to collect performance data. Collection Services, on the other hand, stores your data for each collection in a single collection object. This means lower system overhead when collecting data. The database files can be created as needed.

Note: In order to run a Management Central System Monitor, you do not need to start Collection Services. System Monitors are tied in to the data collected through Collection Services, but the System Monitor will start Collection Services and have it collect the data necessary for that System Monitor

Collection Object

Options

© 2003 IBM Corporation

IBM eServer iSeries

IBM

Notes: Collection Object - Options

Create Database Files Now
Use the Create Database Files dialog to generate database files from a collection. You can use these database files with the Performance Tools for AS/400 licensed program and other applications to produce performance reports.

Cycle Collection Now
Use the Cycle Collection Dialog to cycle the current collection object. This will cause it so that a new collection object is created and data will start being put in this new object and will stop being put in the previous collection object

Create Summary Data Now
Use the Create Summary Data Now dialog to generate summary data from a collection. You use the summary data to display the graphs for the Graph History window. If you create the summary data from a collection object, you can delete the collection object and still see the data in the Graph History window.

Graph History
The Graph History window shows a graphical view of the metrics that have been collected for an extended period of time for a particular monitor. You can contrast the Graph History window with the Monitor window.

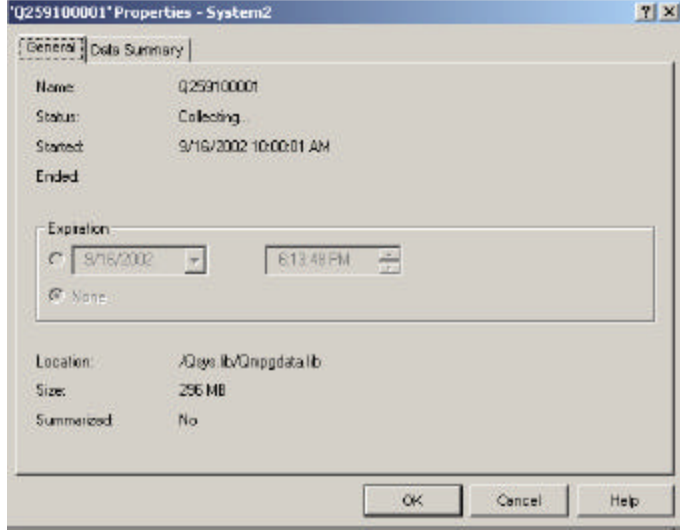

Delete
Use the Confirm Delete dialog to delete the selected collection objects. The collection objects are deleted when you click Delete.

Collection Object

Properties - General

© 2003 IBM Corporation

IBM eServer iSeries IBM

Notes: Collection Object - Properties

The General page of Collection Properties contains general information about the collection object, including its name, location, and size. The status of the collection object is shown, along with the date and time that data collection started and ended.

When the status of the collection object is Cycled, you can change the expiration date, which specifies the date and time this collection object will be deleted from the iSeries system.

Name - The name of the collection object which identifies when the collection object was created.
 Status - The current status of the collection object. Possible Values are Collecting or Cycled.
 Started - The date and time Collection Services started collecting data and storing it in this object
 Ended - The date and time Collection Services stopped storing data in this object
 Expiration - The date and time after which this collection object may be deleted from the AS/400 system.
 Location - The path where this object is stored in the file system.
 Size - The current size of the collection object, in megabytes.
 Summarized - Indicates whether or not you requesting to have the collection object provide summary data.

Collection Properties - Data Summary

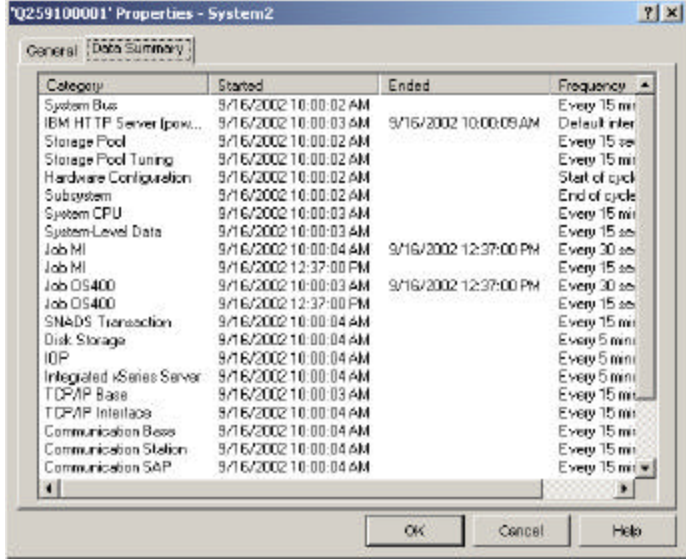

The Data Summary page of Collection Properties contains a detailed list of the data categories stored in this collection object. The list includes the date and time when the collection of each category started and ended, and how frequently data was collected.

Notes:

Collection Object - Create Database Files Now...

Use the Create Database Files dialog to generate database files from a collection. You can use these database files with the Performance Tools for AS/400 licensed program and other applications to produce performance reports.

You can create database files and file members from the same collection object multiple times. If you specify the name of a database file member that already exists, the new data will overwrite the old data.

Member to create - The name of the database file member to create. If you specify the name of a database file member that already exists, the member will be removed from all the database files associated with this collection object. The new data will then be written to the member.

Path - The path where the database files are stored in the file system. Click Browse to select a folder to store the database files.

Data to include - Categories of data for which database files will be generated. All categories are selected by default. If you deselect any category, data will still be collected for that category and stored in the collection object, but it will not be stored in a database file.

Range of data - Date and time range of the data to include in the database files.

Sampling interval - The time interval at which data is extracted from the collection object to be included in the database files.

Viewing data using Graph History

The screenshot shows the IBM iSeries Navigator interface. On the left, the 'Environment: My Connections' tree is visible, with 'Collection Services' highlighted. A red arrow points from the 'Graph History' icon in the toolbar to the 'Graph History' window. The 'Graph History' window displays the following settings:

- Today (Date)
- From: 9/17/2002
- CPU Utilization (Average)
- To: 12:00:00 AM
- 1 minute (Sampling Interval)
- To: 9/17/2002

The graph title is 'CPU Utilization (Average) : System2'. The x-axis shows time from 12:51 to 1:09. The y-axis shows CPU utilization from 0 to 100. The graph shows a line fluctuating between 0 and 100% utilization. Below the graph, the 'System' list shows 'System2' checked.

Notes: Layout

The Graph History window shows a graphical view of the metrics that have been collected for an extended period of time for a particular monitor. You can contrast the Graph History window with the System Monitor window.

The System Monitor window shows real-time data for the last hour and automatically updates the data. The Graph History window displays the selected metric over a longer period of time, for example, a day, a week, a month, or a year. You can view performance detail two ways; one, as real-time data, and two, as historical data.

You can display only one graph at a time. However, you can display multiple Graph History windows to make comparisons, if needed. Initially, no graph is created until you click Refresh.

The Graph History window contains four panes.

Notes: Viewing Data

A request will be made to the system chosen to retrieve data for the specified time range.

If detailed data is available for part of the specified time range it will be returned.

If detailed data is not available but the raw data is available, and the period is within the graph retention period, detailed data will be dynamically converted from the raw data and returned.

If no detailed data is available for a period in the time range, summary data will returned, if it is available.

To make sure detailed data and/or summary data is previously created, select the check boxes on the Collection Services Property Page to create graph data and summary data when Collection Services cycles.

Notes: Viewing Data

Each endpoint system is represented by a unique graph line. Click the legend icon in the lower right corner of any graph to see which system is represented by each line. Here are some actions that you can perform:

To change the color, width, or style of the line for each system, click Options from the menu bar on the iSeries Navigator window and select User Preferences. To change the size of the Graphs pane, click the icon in the right-hand corner of the title bar of any graph to minimize the graph to just the title bar. Click the icon again to restore the graph to its previous size. To see the Details of the data associated with the collection point, click any collection point on a graph line.

Collection points on the graph line are shown by three different graphics that correspond to the three levels of data that are available:

- A square collection point means the data includes both the detailed information and properties information.
- A triangular collection point represents summarized data that contains detailed information.
- A circular collection point represents data that contains no detailed information or properties information.
